

Clinical Laboratory COVID-19 Response Call

Monday, April 5, 2021 at 3:00 PM EDT

- **Welcome**
 - Nancy Anderson, Division of Laboratory Systems, CDC
- **Emergence of SARS-CoV-2 Variants and Impact on IVD Testing**
 - Richard Creager, NIH RADx Variant Task Force
- **Saliva as a Sample Type for SARS-CoV-2 Detection**
 - Anne Wyllie, Yale University
- **FDA Update**
 - Tim Stenzel, U.S. Food and Drug Administration (FDA)

Biological Risk Assessment Webpage

<https://www.cdc.gov/safelabs/resources-tools/bio-risk-assessment.html>

The screenshot shows the 'Safe Labs' webpage. The header includes 'Safe Labs' and 'Biosafety > Resources'. A left sidebar contains navigation links: 'Biosafety', 'Initiatives', 'Trainings', and 'Resources'. The 'Resources' section is expanded to show 'Biological Risk Assessment: General Considerations for Laboratories'. Below this is a 'Related Links' section with a link to 'Division of Laboratory Systems (DLS)'. The main content area features the title 'Biological Risk Assessment: General Considerations for Laboratories' and an 'Introduction' section. A blue box titled 'What is it?' contains text about CDC's Division of Laboratory Systems and the risk management process. Below this is a 'Risk Management Process' section with a circular diagram showing five steps: 'Identify Hazards and Risks', 'Evaluate Risks', 'Determine Controls', 'Implement Controls', and 'Review Effectiveness of Controls'. To the right of the diagram is a 'Process Steps' section listing five numbered steps with corresponding links.

Biological Risk Assessment: General Considerations for Laboratories

Introduction

What is it?

CDC's Division of Laboratory Systems knows that incidents involving biological, chemical, physical, and radiological hazards can have a significant impact on the safety and health of those who work in laboratory settings. Risk management is a continuous process to identify, assess (evaluate), control, and monitor risks. The risk assessment components of the overall risk management process are:

Risk Management Process

```
graph TD; A[Identify Hazards and Risks] --> B[Evaluate Risks]; B --> C[Determine Controls]; C --> D[Implement Controls]; D --> E[Review Effectiveness of Controls]; E --> A;
```

Process Steps

Step 1: [Identify the hazards and risks.](#)

Step 2: [Evaluate the risks.](#)

Steps 3-4: [Implement a risk mitigation plan, as needed.](#)

Step 5: [Evaluate effectiveness of controls.](#)

Testing Overview Update

<https://www.cdc.gov/coronavirus/2019-ncov/hcp/testing-overview.html>

The screenshot shows the CDC website's COVID-19 page for Healthcare Workers. The header includes the CDC logo, the text "Centers for Disease Control and Prevention CDC 24/7: Saving Lives. Protecting People™", and a search bar for "Search COVID-19". Below the header is a navigation bar with links for "Your Health", "Vaccines", "Cases & Data", "Work & School", "Healthcare Workers" (which is highlighted), "Health Depts", "Science", and "More". A secondary navigation bar features icons and text for "WEAR A MASK", "STAY 6 FEET APART", "AVOID CROWDS", and "GET A VACCINE".

The main content area is titled "Overview of Testing for SARS-CoV-2 (COVID-19)" and is dated "Updated Mar. 17, 2021". A "Print" link is also visible. Below the title is a "Summary of Recent Changes" section, which includes a sub-header "Updates as of March 17, 2021" and a list of updates:

- Expansion on the description of categories of tests, choosing a test, and addition of intended uses of testing
- Addition of health equity considerations related to testing, including discussion on ensuring equitable testing access and availability
- Discussion on expanded availability to, and use of, screening tests to reduce asymptomatic spread
- Discussion on testing of vaccinated individuals and interpretation of test results
- Inclusion of links to setting-specific testing guidance

A left-hand sidebar menu is visible, with "Healthcare Workers" selected. Under "Healthcare Workers", the "Testing" section is expanded, showing "Testing Overview" (selected), "Performing Broad-Based Testing", and "Testing Healthcare Personnel". Other menu items include "Vaccination", "Clinical Care", "Infection Control", "First Responders", and "Exposure in Healthcare Settings".

Nucleic Acid Amplification Tests (NAATs)

Updated Mar. 28, 2021 [Print](#)

A Nucleic Acid Amplification Test, or NAAT, is a type of viral diagnostic test for SARS-CoV-2, the virus that causes COVID-19. NAATs detect genetic material (nucleic acids). NAATs for SARS-CoV-2 specifically identify the RNA (ribonucleic acid) sequences that comprise the genetic material of the virus.

NAATs for SARS-CoV-2 test specimens from either the upper or lower respiratory tract. The type of specimen collected when testing for SARS-CoV-2 is based on the test being performed and the manufacturer's instructions. For initial diagnostic testing for current SARS-CoV-2 infection, CDC recommends collecting and testing an upper respiratory specimen, such as nasopharyngeal, nasal mid-turbinate, or anterior nasal. See CDC's [Collecting and Handling of Clinical Specimens for COVID-19 Testing](#).

The NAAT procedure works by first amplifying – or making many copies of – the virus's genetic material that is present in a person's specimen. Amplifying or increasing the copies of nucleic acids enables NAATs to detect very small amounts of SARS-CoV-2 RNA in a specimen, making these tests highly sensitive for diagnosing COVID-19. In other words, NAATs can reliably detect small amounts of SARS-CoV-2 and are unlikely to return a false-negative result of SARS-CoV-2.

NAATs can use many different methods to amplify nucleic acids and detect the virus, including but not limited to:

- Reverse transcription polymerase chain reaction (**RT-PCR**)
- Transcription mediated amplification (**TMA**)
- Loop mediated isothermal amplification (**LAMP**) tests including:
 - Nicking endonuclease amplification reaction (**NEAR**)
 - Helicase-dependent amplification (**HDA**)
 - Clustered regularly interspaced short palindromic repeats (**CRISPR**)
- Strand displacement amplification (**SDA**)

CLIA SARS-CoV-2 Variant Testing FAQ

<https://www.cms.gov/files/document/clia-sars-cov-2-variant.pdf>

Revised on March 19, 2021

CLIA SARS-CoV-2 Variant Testing Frequently Asked Question Date: 3/19/2021

Does a facility that performs surveillance testing to identify SARS-CoV-2 genetic variants need a CLIA certificate?

CMS is temporarily exercising enforcement discretion under CLIA for SARS-CoV-2 genetic variant testing on identified specimens in which patient-specific results are reported to State or local Public Health Departments. As defined by Centers for Disease Control and Prevention (CDC), public health surveillance testing for SARS-CoV-2 is intended to monitor community- or population-level outbreaks of disease, or to characterize the incidence and prevalence of disease. Public health surveillance testing is performed on de-identified specimens, and thus results are not linked to individuals. Public health surveillance testing cannot be used for individual decision-making. See CDC's [Testing Strategies for SARS-CoV-2 \(Frequently Asked Questions about Coronavirus \(COVID-19\) for Laboratories\)](#).

Generally, surveillance testing using sequencing technology to identify SARS-CoV-2 genetic variants can be performed in a facility that is NOT CLIA certified, provided that patient-specific results are **not** reported to (1) the individual who was tested or (2) their health care provider. If at any time a facility intends to perform testing on identified specimens and report a patient-specific SARS-CoV-2 genetic variant test result to the individual who was tested or to their health care provider, the facility must comply with CLIA and is thereby required to obtain the appropriate CLIA certificate in accordance with 42 CFR Part 493, laboratory requirements.

Upcoming CLIAC Meeting

CLIAC Spring 2021

April 14 – 15, 11:00 AM – 6:00 PM, EDT (Virtual Meeting)

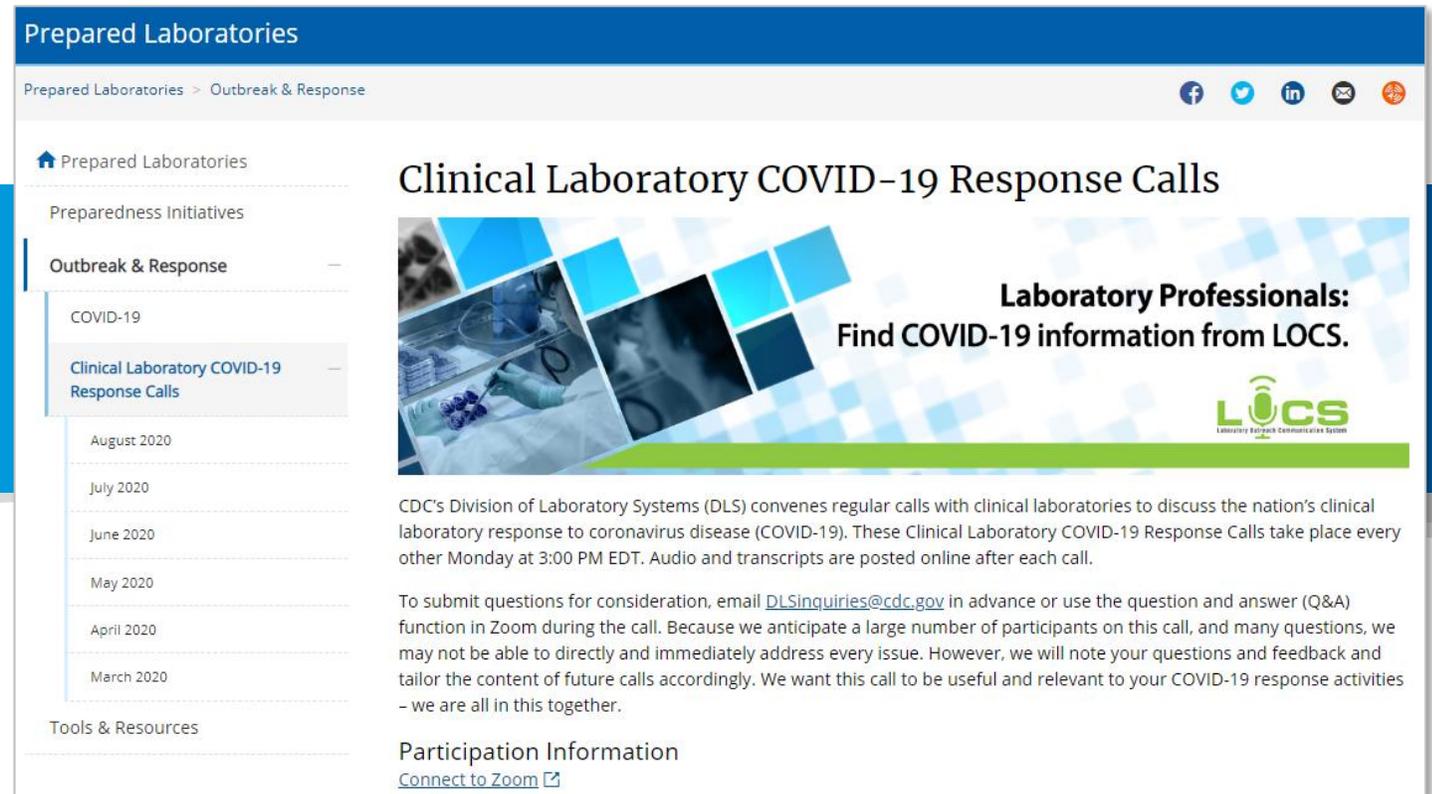

- See www.cdc.gov/cliac for meeting information
- Contact CLIAC@cdc.gov to submit written public comments or to present a public comment orally during the meeting

CDC Preparedness Portal

<https://www.cdc.gov/csels/dls/preparedlabs/covid-19-clinical-calls.html>

Find CLCR call information, transcripts, and audio recordings on the CDC Preparedness Portal

The screenshot displays the 'Prepared Laboratories' section of the CDC Preparedness Portal. The page title is 'Prepared Laboratories' and the breadcrumb is 'Prepared Laboratories > Outbreak & Response'. The main content area is titled 'Clinical Laboratory COVID-19 Response Calls' and features a banner with the text 'Laboratory Professionals: Find COVID-19 information from LOCS.' and the LOCS logo. Below the banner, there is a paragraph explaining that the CDC's Division of Laboratory Systems (DLS) convenes regular calls with clinical laboratories to discuss the nation's clinical laboratory response to COVID-19. A second paragraph provides instructions on how to submit questions for consideration. At the bottom, there is a 'Participation Information' section with a link to 'Connect to Zoom'. On the left side of the page, there is a navigation menu with options for 'Prepared Laboratories', 'Preparedness Initiatives', 'Outbreak & Response', 'COVID-19', 'Clinical Laboratory COVID-19 Response Calls', and 'Tools & Resources'. The 'Clinical Laboratory COVID-19 Response Calls' menu item is expanded, showing a list of call dates from August 2020 to March 2020.

Schedule for Clinical Laboratory COVID-19 Response Calls

The next call will be on **Monday, April 19** from
3:00 PM to 4:00 PM EDT

We Want to Hear from You!

Training and Workforce Development

Questions about education and training?

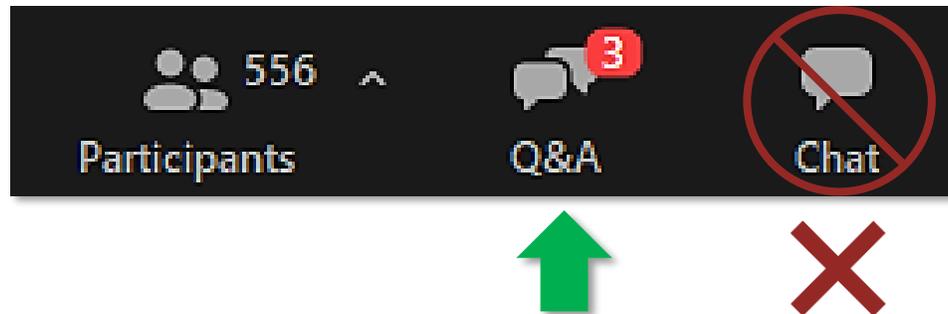

Contact LabTrainingNeeds@cdc.gov

How to Ask a Question

- **Using the Zoom Webinar System**

- Click the **Q&A** button in the Zoom webinar system
- Type your question in the **Q&A** box and submit it
- **Please do not submit a question using the chat button**

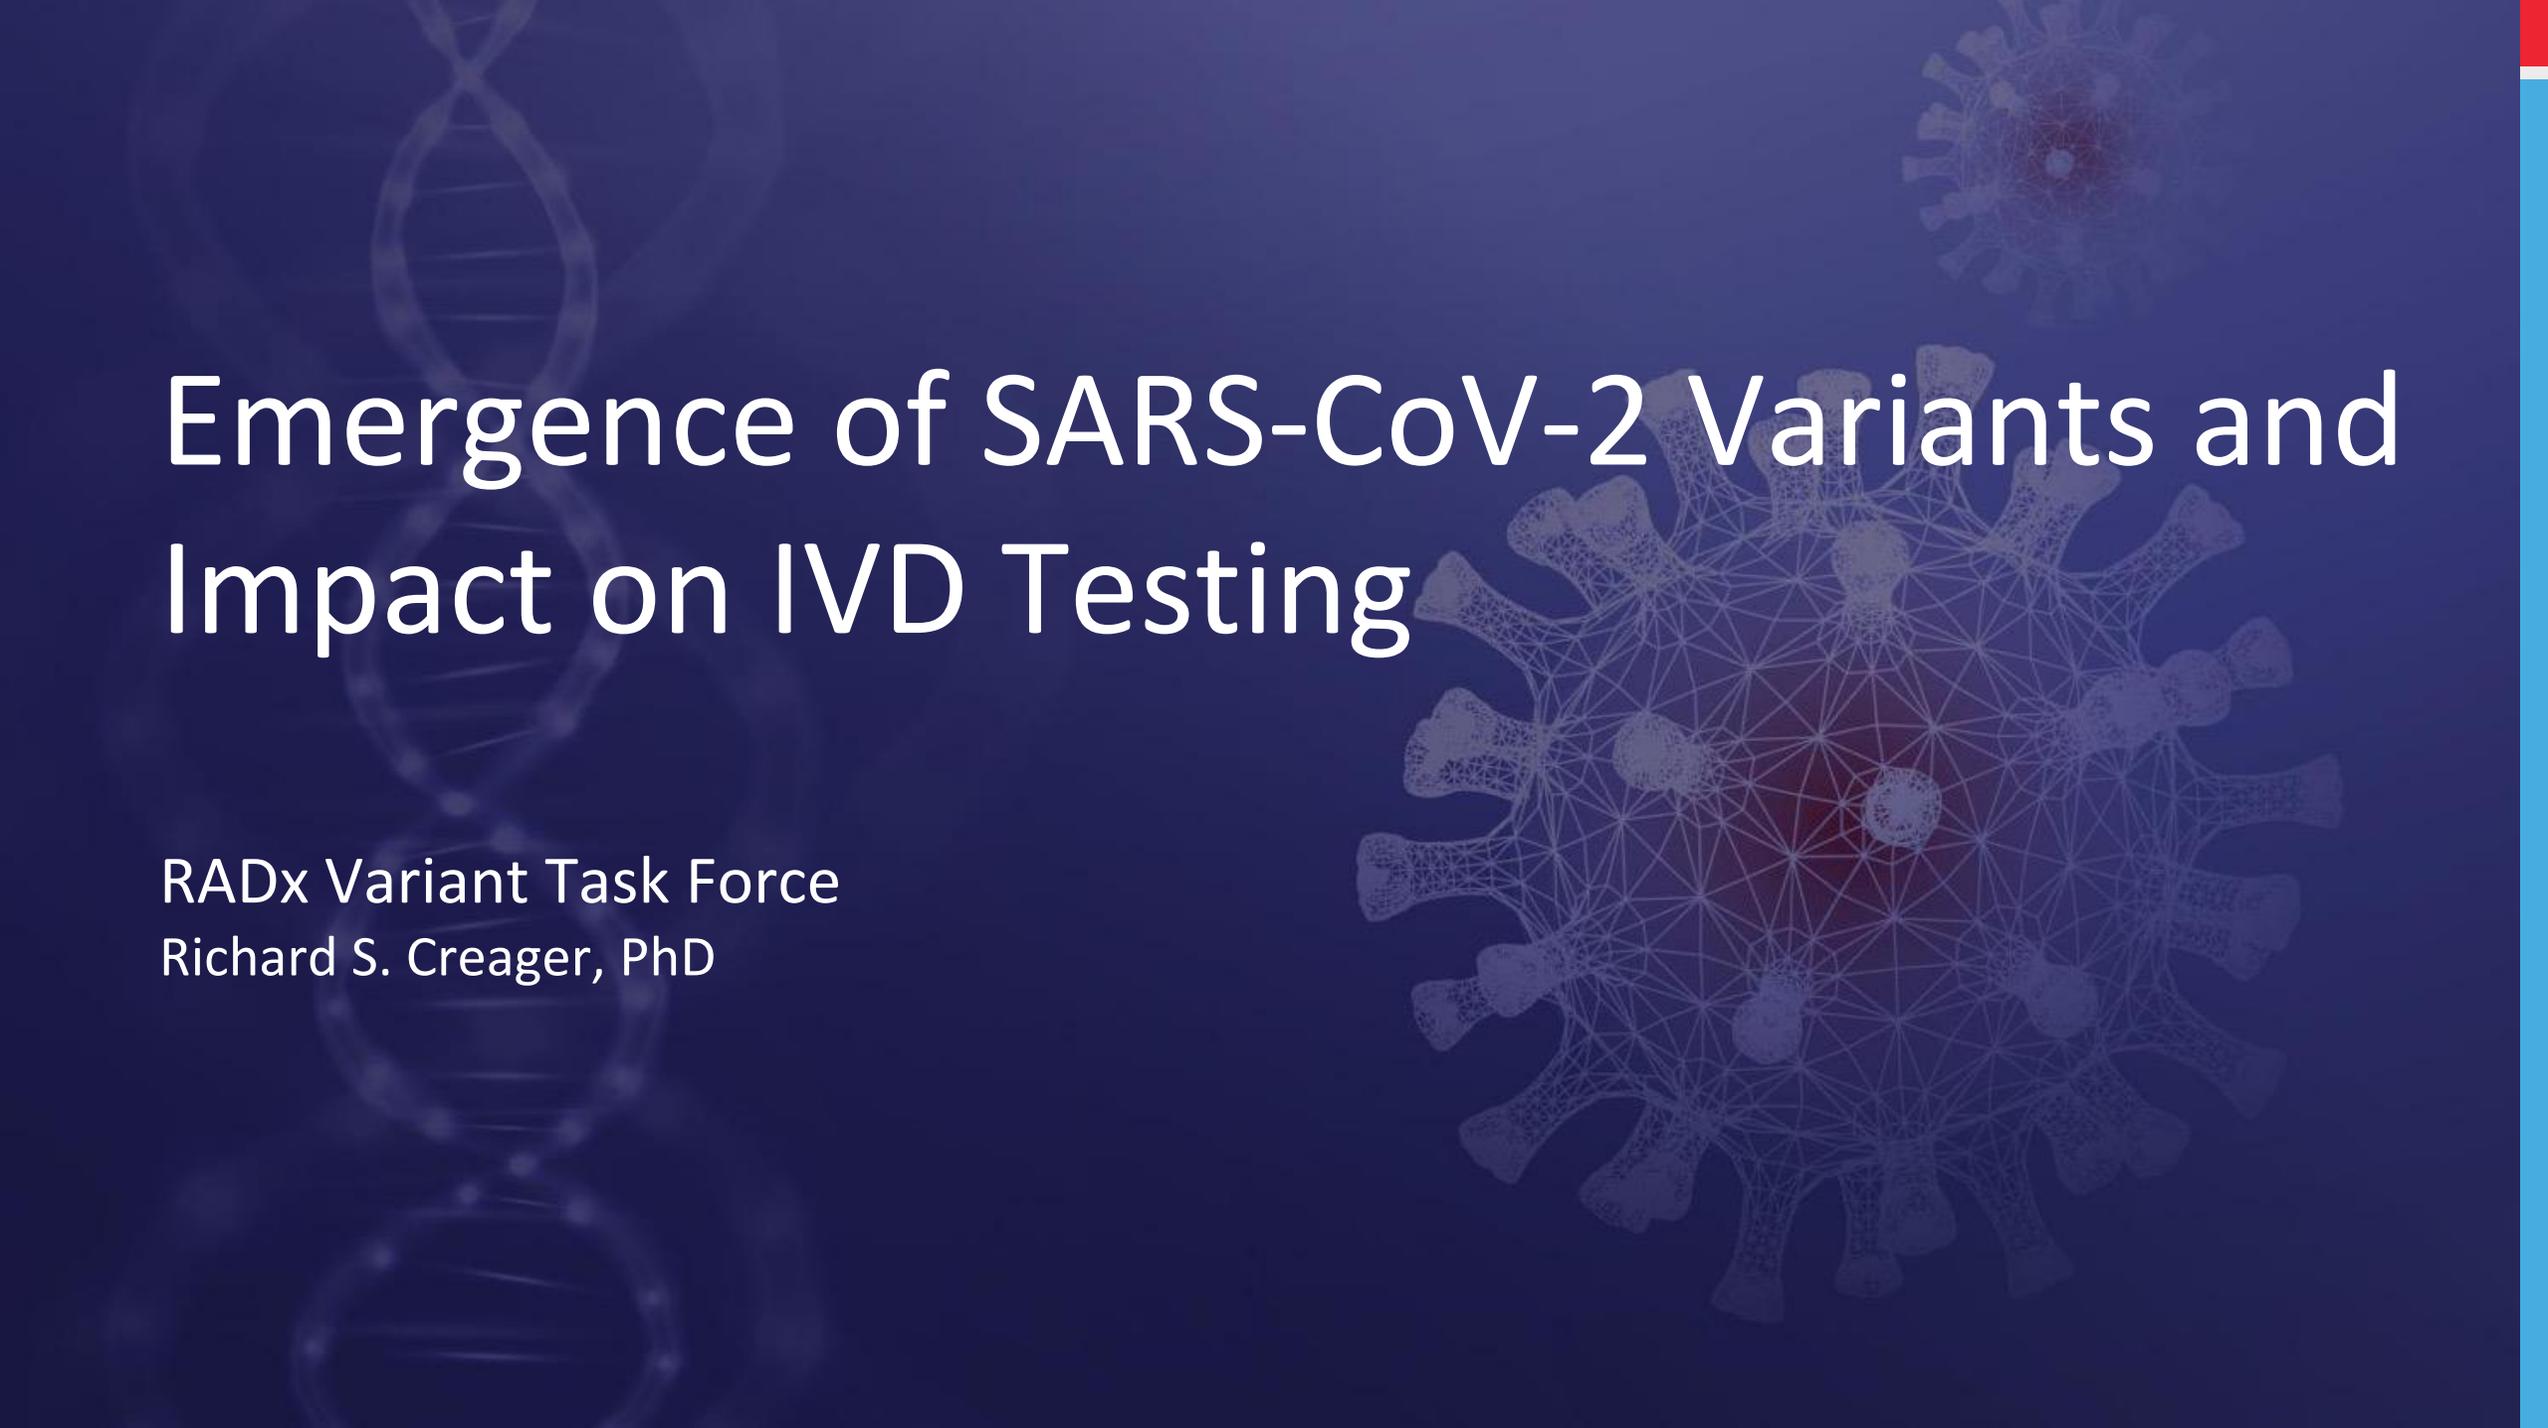

- For media questions, please contact CDC Media Relations at media@cdc.gov
- If you are a patient, please direct any questions to your healthcare provider

Slide decks may contain presentation material from panelists who are not affiliated with CDC. Presentation content from external panelists may not necessarily reflect CDC's official position on the topic(s) covered.

Overview: RADx Variant Task Force

Established January 2021

The RADx Variant Task Force is a cross-discipline and cross-organization group of scientists and industry leaders with expertise in virology and diagnostic testing.

Objective

Rapidly analyze whether the performance of any of RADx's portfolio of diagnostic tests were affected by the mutations in the new variants.

SARS-CoV-2 Variants: Nucleic Acid Amplification (NAAT) and Antigen Testing

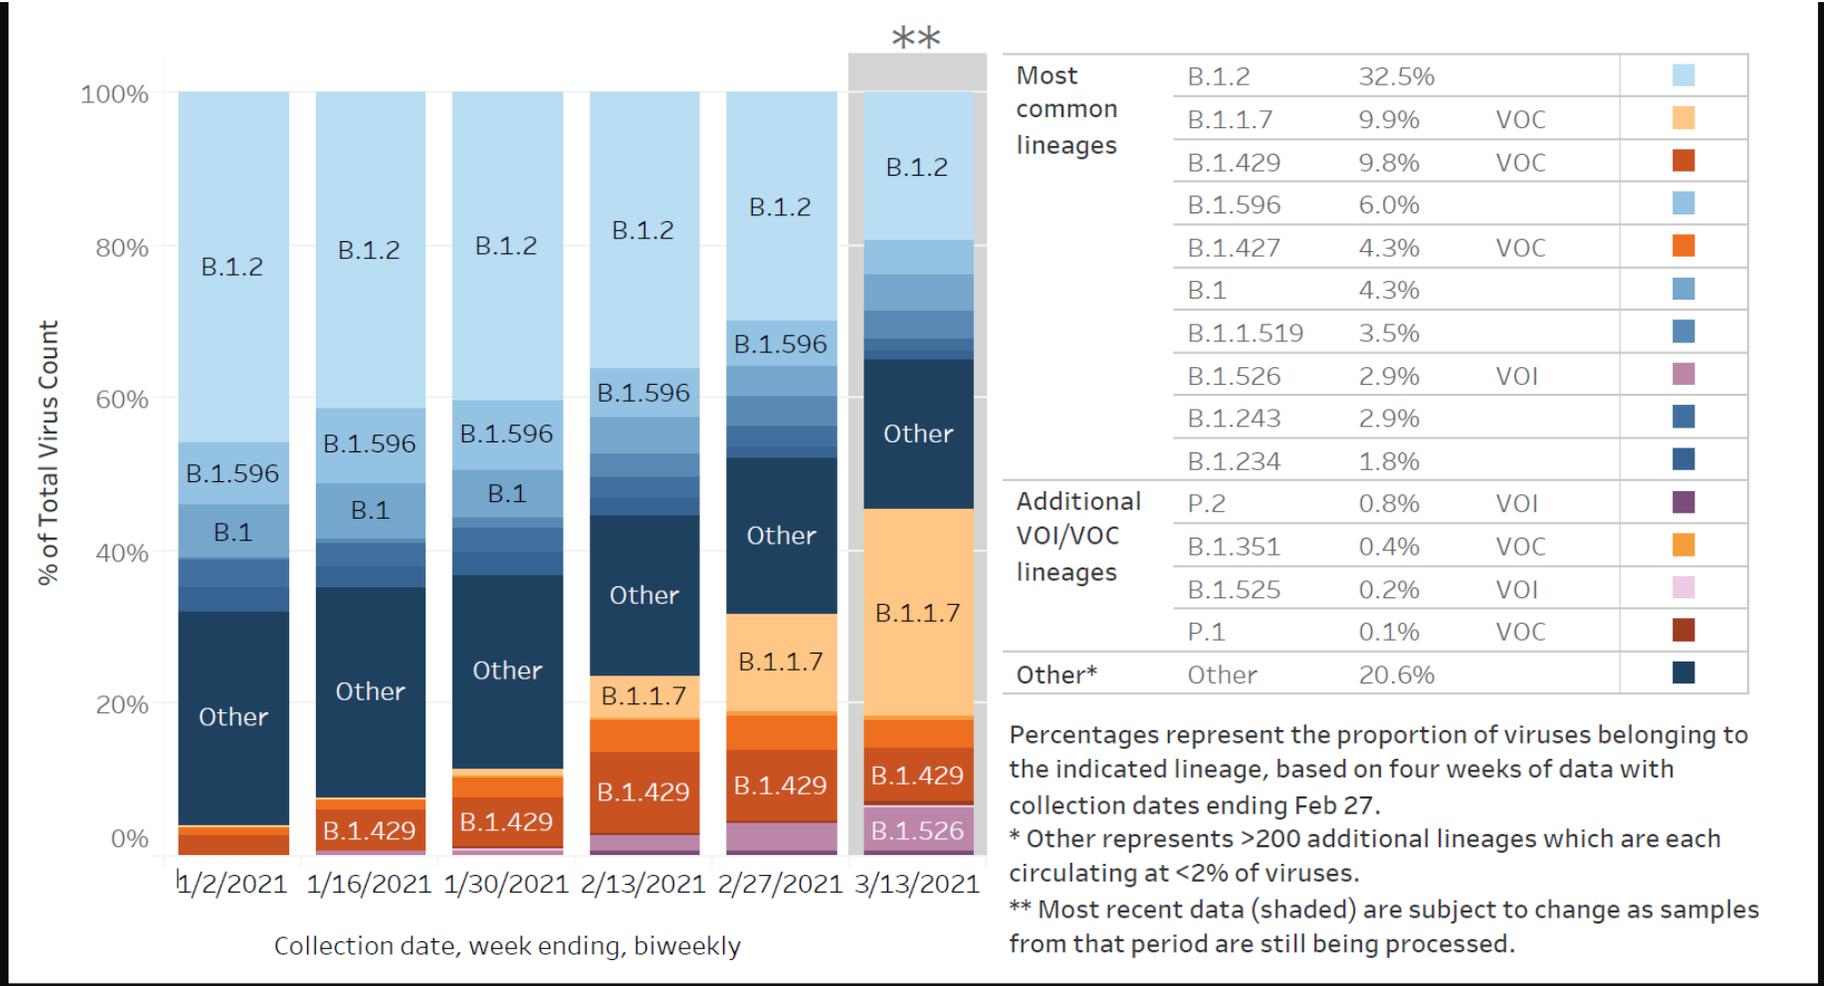

- Employs arrangement of primers and/or probes (or antibodies) to recognize and bind to specific sequences or protein in the virus
- Viral variants of interest arise through changes in their nucleotide sequences and amino acids
- Nucleotide changes impacts primer/probe ability to bind/amplify changed sequence
- Amino acid substitutions or deletions may change conformation structure or folding of the viral protein (epitope)

Change due to variant	Impact on Test
No binding	May lead to false negative
Reduced binding	May lead to decreased sensitivity (limit of detection)

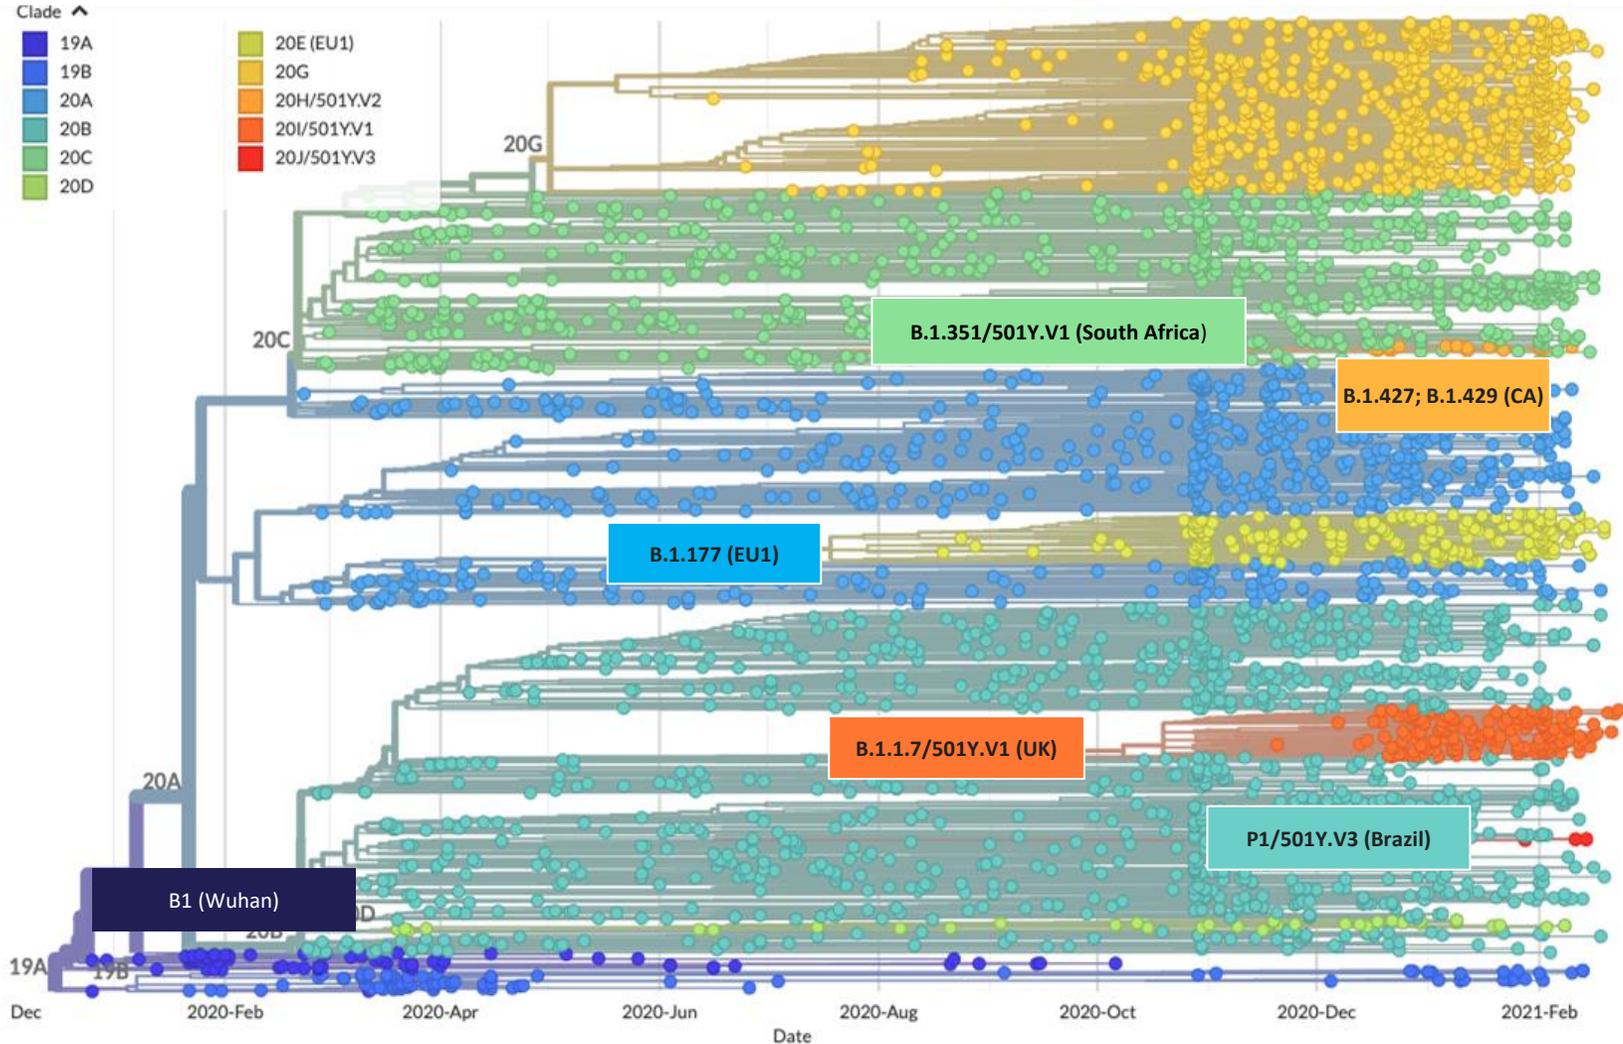

***in silico* analysis and lab testing are required**

- Used to model the impact of the mutation may primer/probe binding
- Lab testing is needed to confirm the *in silico* analysis

SARS-CoV-2 Variants Circulating in the United States

SARS-CoV-2 Variant Timeline: North America

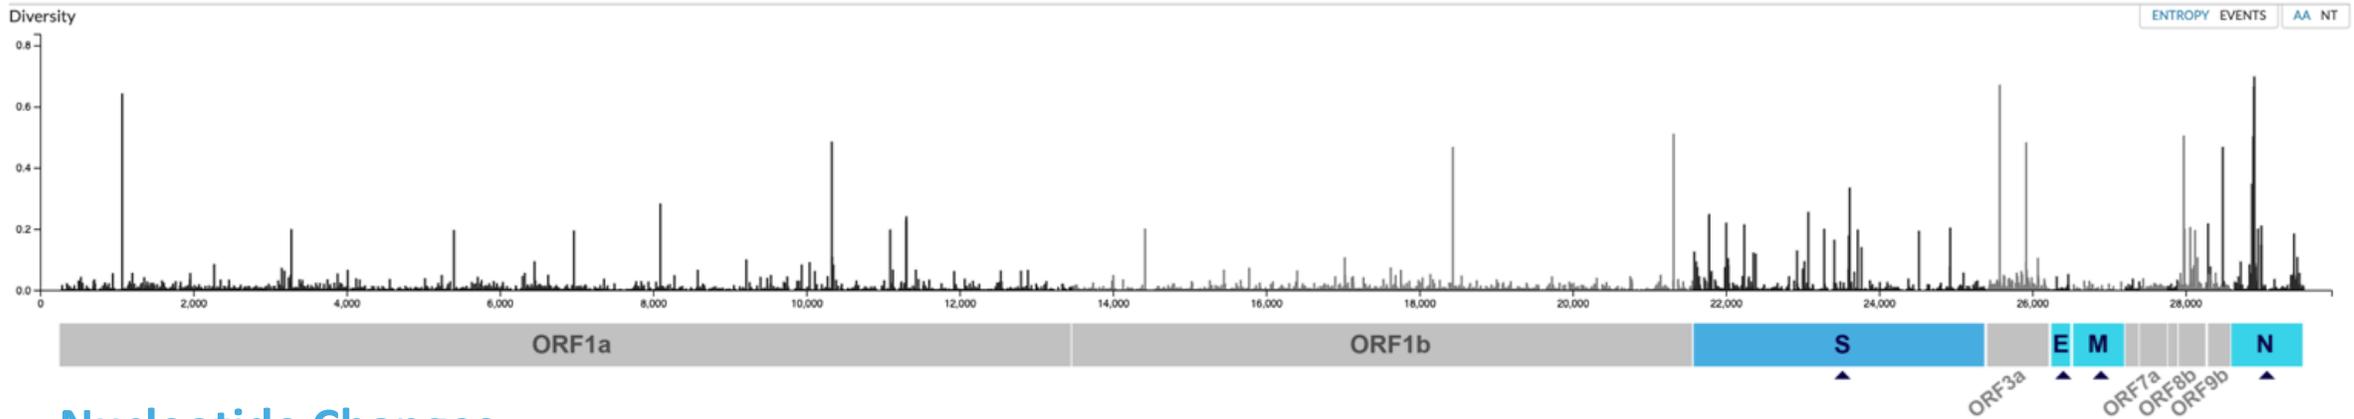

Key takeaways:

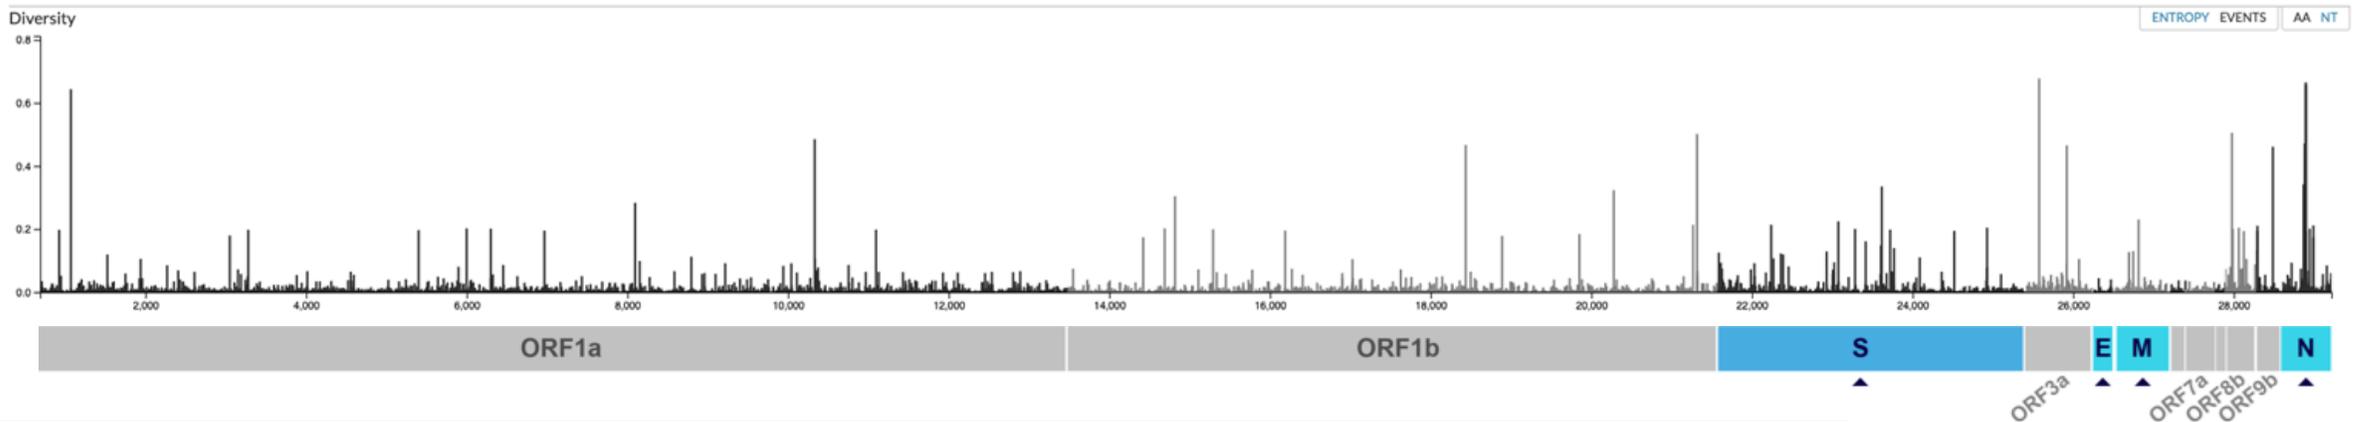

- Graphic depicts Dec 2019 to February 2021
- "Variants" are really families of related mutations
- B117 is not "one thing" but literally thousands of distinct sequences
- Over 800,000 unique sequences in GISAID

SARS-CoV-2: Mutations Across the Viral Genome: North America

Amino Acid Changes

Nucleotide Changes

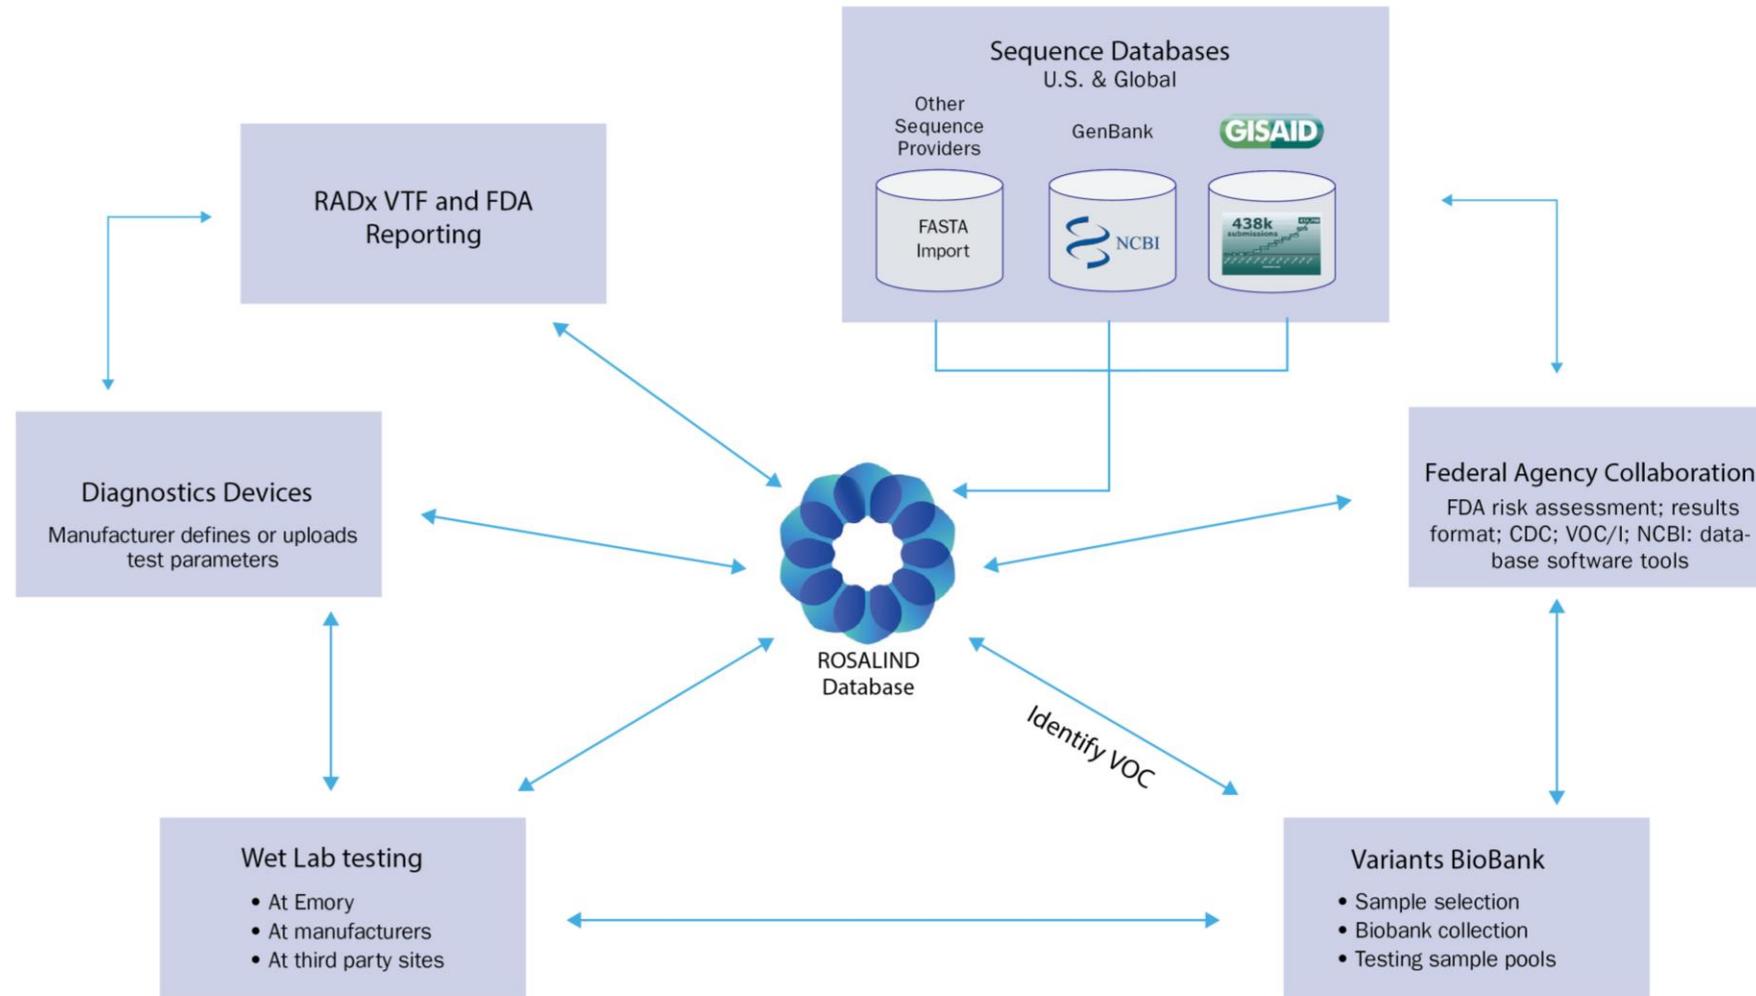

Key takeaway:

Every gene is impacted, not just spike protein

Big spikes are occurring for a reason - evolutionary advantage, biological pressure

RADx VTF Components

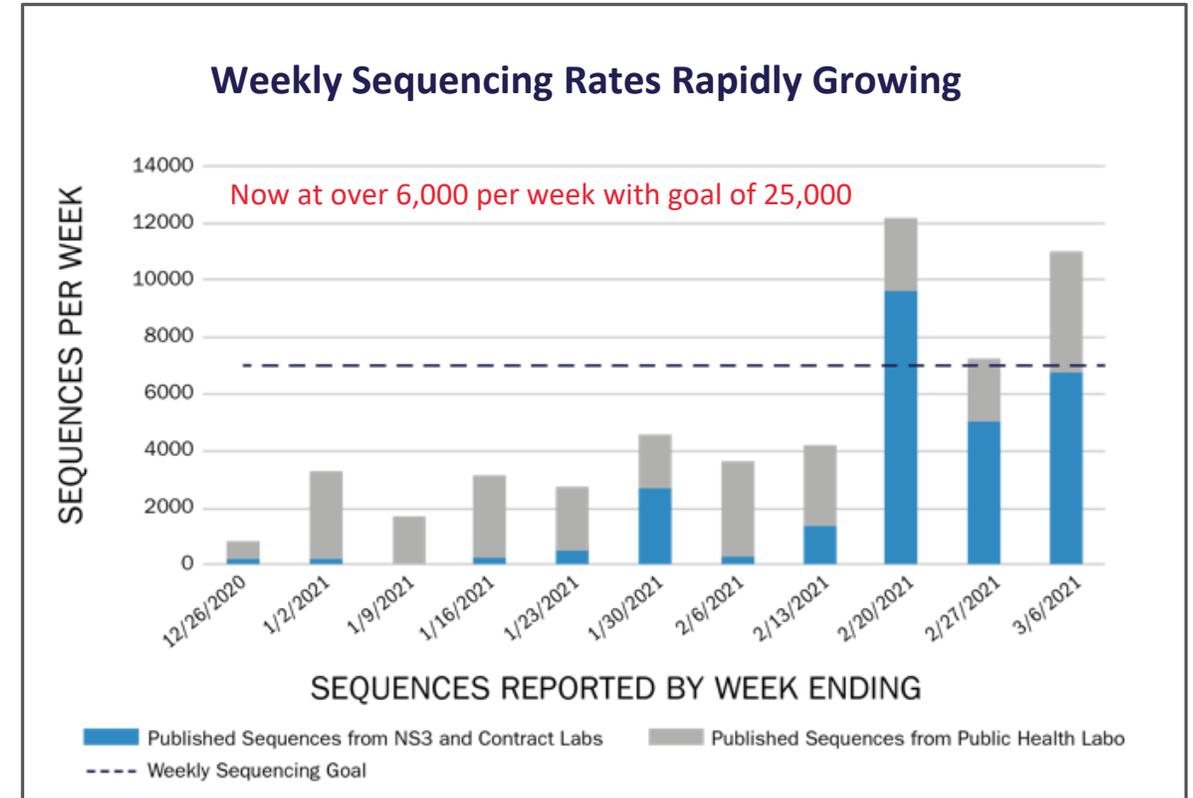

CDC SARS-CoV-2 Surveillance System

CDC Leads the National SARS-CoV-2 Surveillance System (NS3)

- Partnering with commercial diagnostic laboratories
- Collaborating with universities
- Supporting state, territorial, local and tribal health department

Goals

- Detect ability to spread more quickly
- Detect ability to cause milder or more severe disease
- Detect ability to evade detection by specific diagnostic tests
- Detect decreased susceptibility to therapeutics that employ monoclonal antibodies
- Detect ability to evade natural or vaccine-induced immunity

RADx VTF: Progress

Bioinformatics

- In collaboration with the FDA and NIH, a custom bioinformatics platform was developed for the detection of variants of concern and to evaluate the effect of the variants on diagnostics assays by both informatics approaches and integration of wet lab results .
- Pulls information from comprehensive global and US-specific datasets including the GISAID, NCBI GenBank and Emory variant biobank
- Results reported to RADx and individual teams if potential issues are detected

Variants Sample Procurement and BioBank at Emory University

- Sourcing variant samples from CDC funded sequencing laboratories across the country
- Procured >800 samples covering > 12 mutations including variants B.1.2, B.1.1.7, B1.351, P1, P2, B.1.427, B.1.429, B.1.525 and B.1.526.

Lab Testing with Variants

- Testing of RADx portfolio with variant sample pools (five serial diluted concentrations) begins in April.
- Test results upload to Rosalind platform for reporting and optimization of analysis pipelines

Bioinformatics Analysis Pipeline and Results

INCIDENT ANALYSIS COVERAGE MAP

Rapidly assess test coverage & issues

Comprehensive analysis for each diagnostic test with summary by region

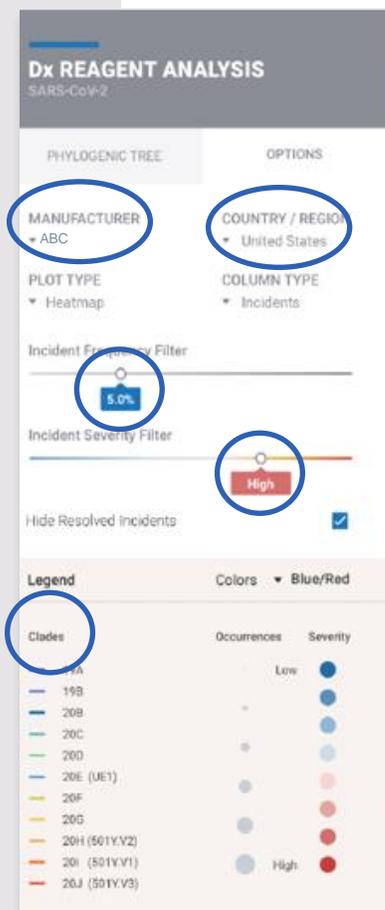

Highlights the new and ongoing variants, based on most recent data and frequency history

RADx & agencies have option to view each manufacturer

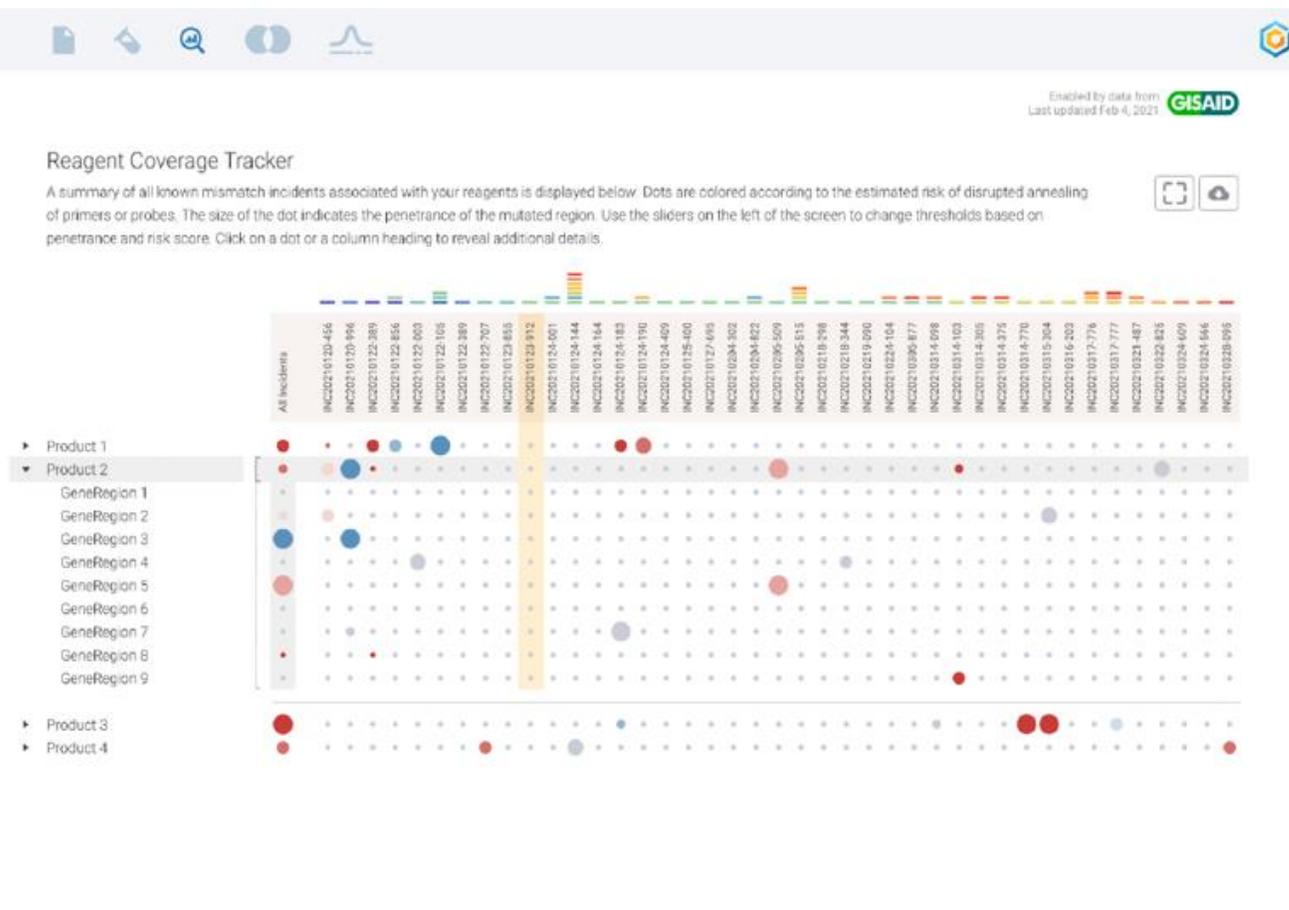

Each manufacturer sees private results

Geographic selection shows emerging strains/clades/mutations

Phylogenetic tree shows evolution between strains/clades

Example Bioinformatics Output

Summary

SARS-CoV-2 continuing to mutate

- The virus is rapidly mutating in the U.S.
- New variants of concern are appearing in multiple states
- Impacting testing, vaccines and public health

We must remain vigilant and collect real time field data

- Surveillance is critical... and then need to be proactive
- Continue to find new ways to rapidly accelerate development, or adjustment, of tests, therapeutics and vaccines

RADx model greatly expedites speed to address new and emerging potential SARS-CoV-2 testing issues

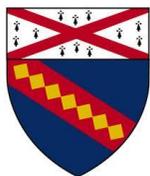

- Need to continuously monitor the field and rapidly innovate as the scientific evidence dictates

Saliva as a sample type for SARS-CoV-2 detection

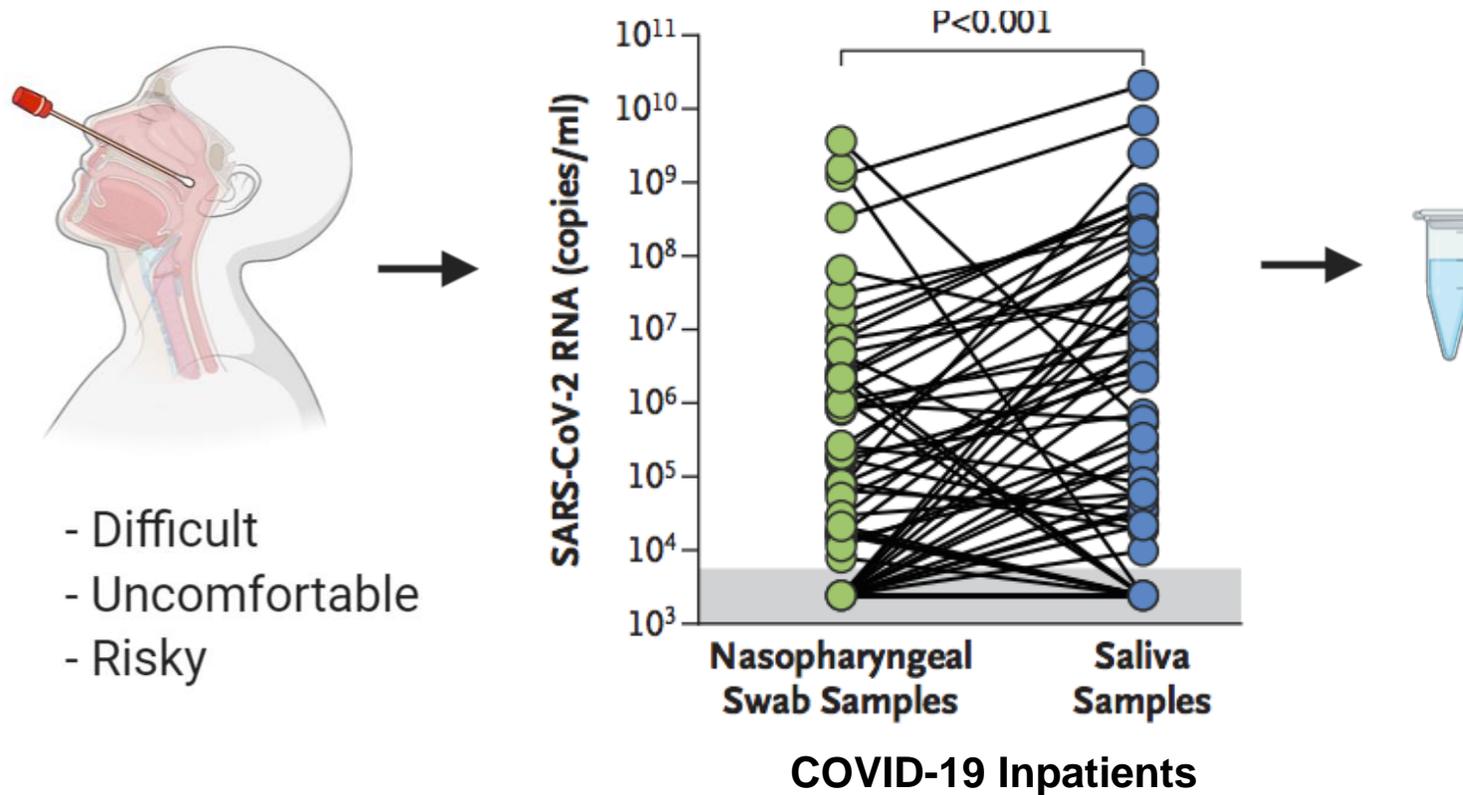

Anne L. Wyllie, PhD

Associate Research Scientist

Epidemiology of Microbial Diseases

Yale SCHOOL OF PUBLIC HEALTH

Saliva as a sample type to aid testing challenges

➤ Saliva is the collection of all oral fluid

- Not sputum or mucus
- No sniffing or coughing (also risk of respiratory droplets)

➤ If not properly collected it can be difficult to work with

➤ Saliva is not a traditional diagnostic sample type

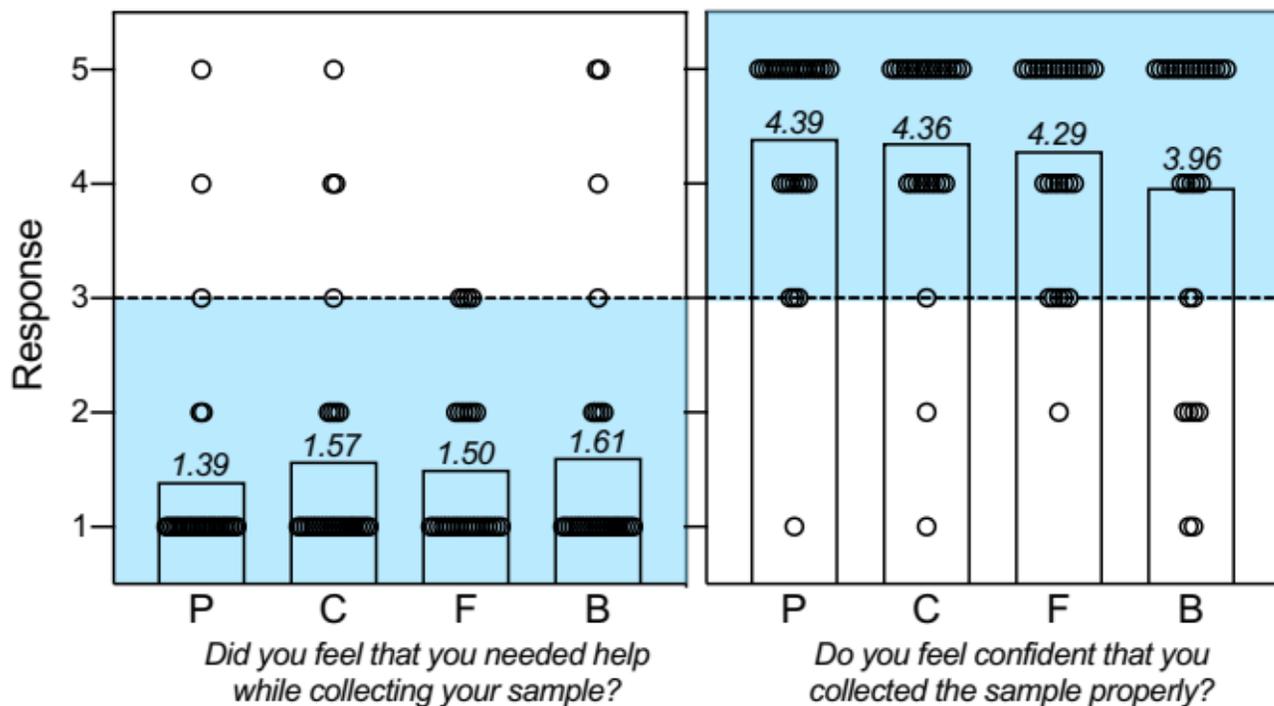

➤ Methods for swabs don't necessarily work on saliva:

- From 54 RT-qPCR-based saliva vs. swab comparison studies:
 - 69% found saliva to have greater or similar ($\leq 10\%$ difference) sensitivity
 - Saliva detected an additional 10% of positive cases (NP swab negative)

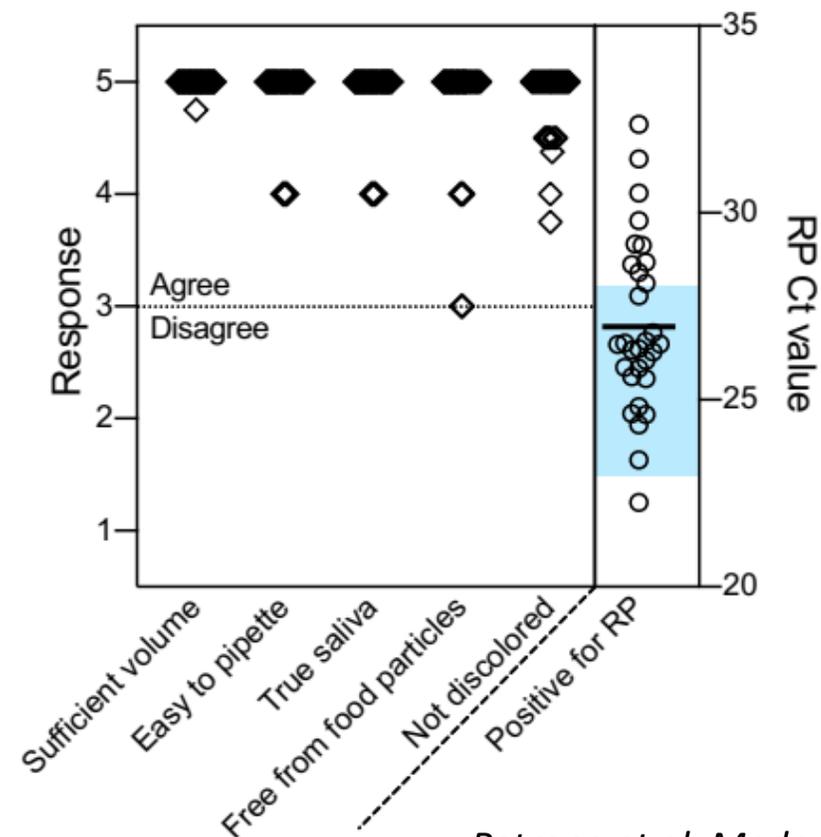

Discrepancies in comparison studies due to poor samples or methods?

- Be patient, think about your favorite food, don't sniff or cough, don't 'spit'
- 30 study participants, 4 devices each, "unobserved" collection

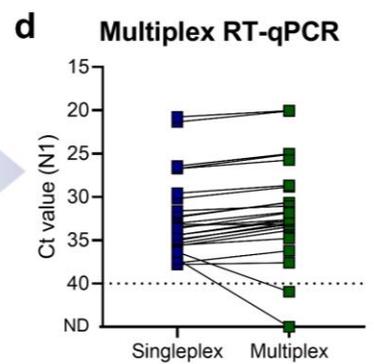

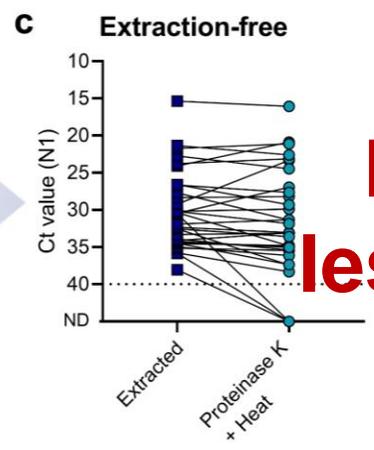

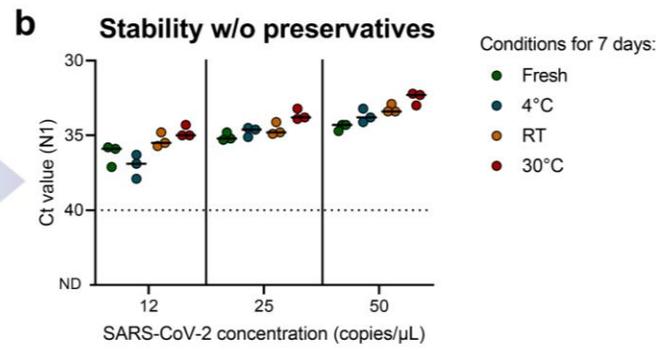

Participant feedback

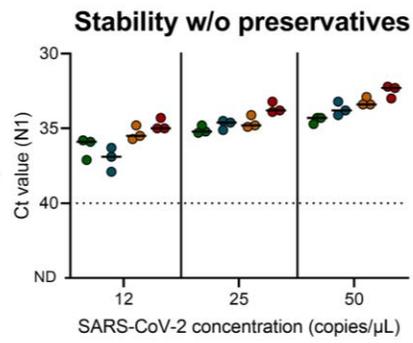

Lab feedback

SalivaDirect™: extraction-free and dualplex RT-qPCR

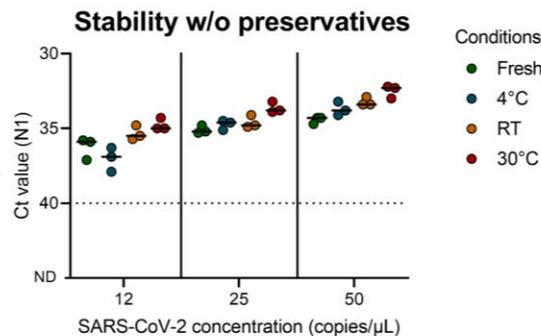

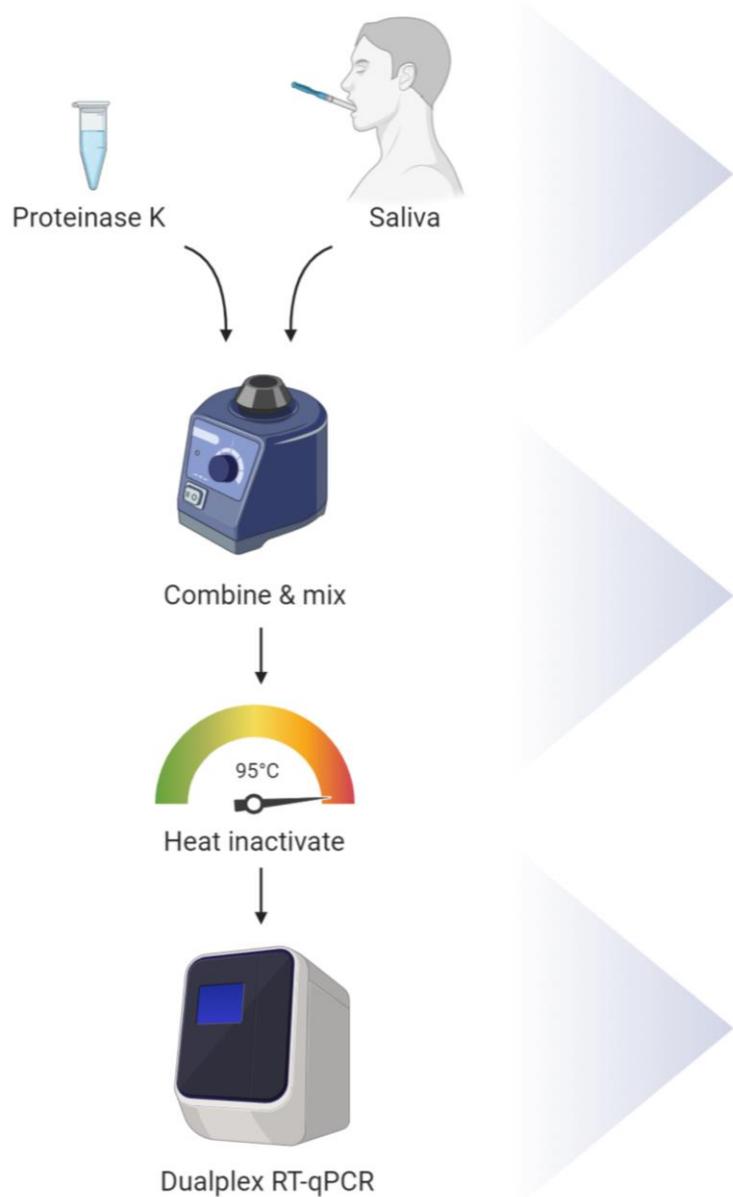

**Less invasive, less expensive,
less prone to supply chain issues**

Saliva is stable without preservatives
No expensive collection device required

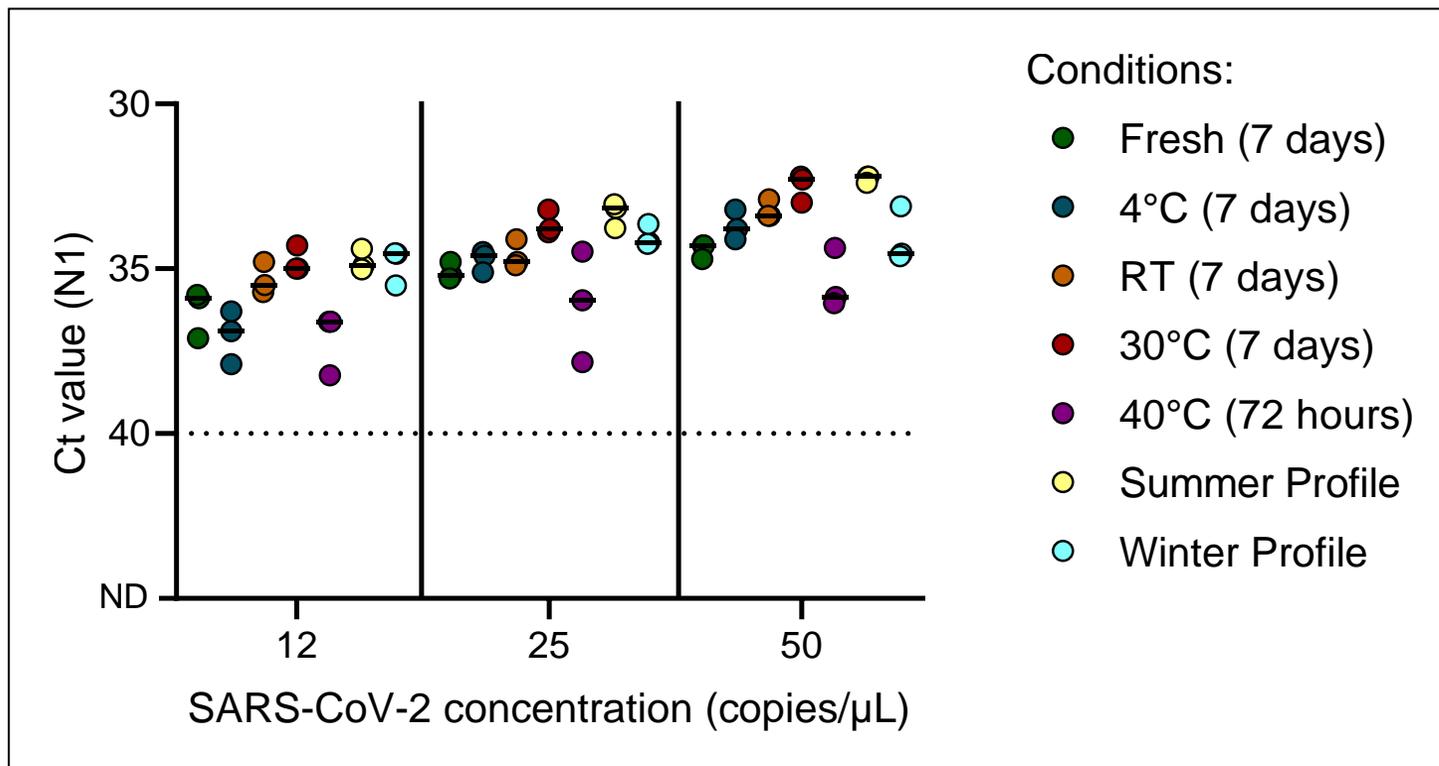

Maintains sensitivity w/out RNA extraction
Removes expensive and time-consuming step

Maintains sensitivity with dualplex PCR
Low detection limits and internal control

Saliva is stable without preservatives

No expensive collection device required

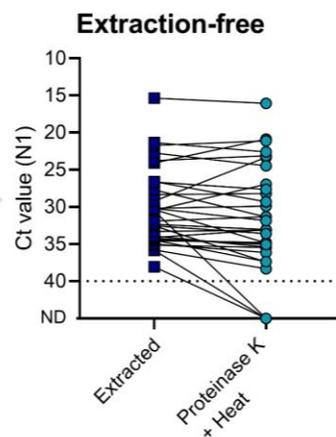

Combine & mix

Heat inactivate

Dualplex RT-qPCR

Saliva is stable without preservatives

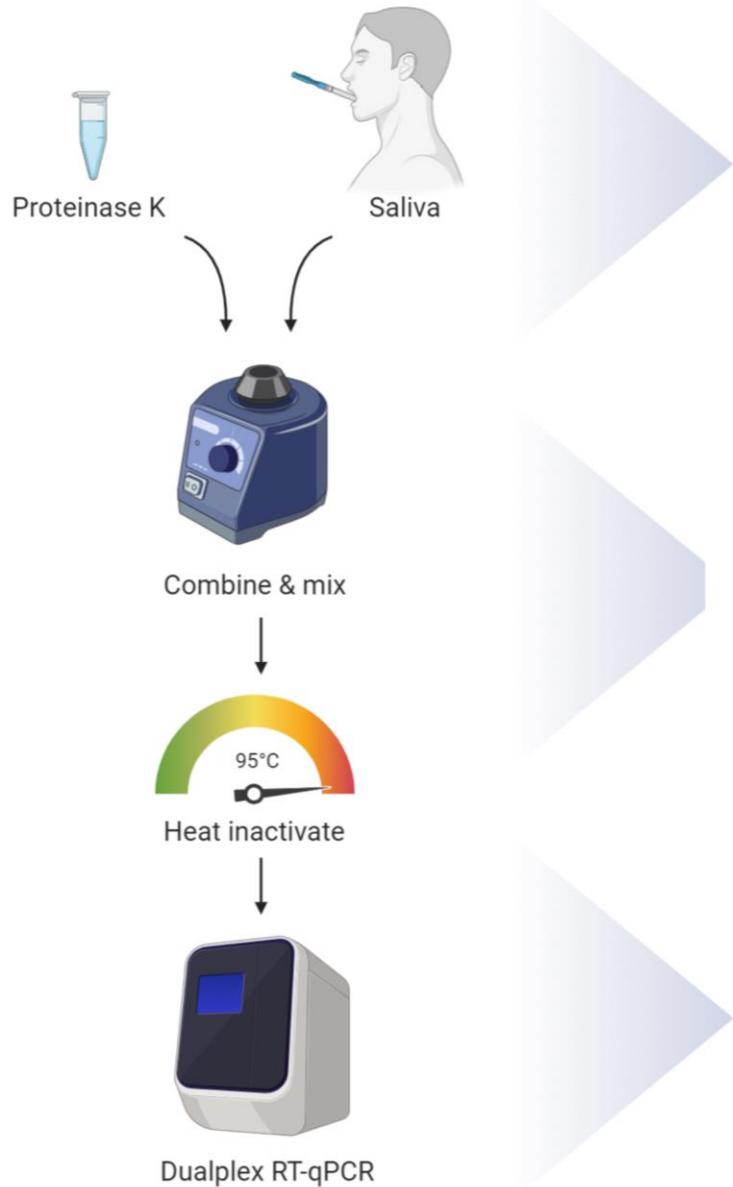

No expensive collection device required

Maintains sensitivity w/out RNA extraction

Removes expensive and time-consuming step

Maintains sensitivity with dualplex PCR

Low detection limits and internal control

Saliva is stable without preservatives
No expensive collection device required

Maintains sensitivity w/out RNA extraction
Removes expensive and time-consuming step

Maintains sensitivity with dualplex PCR
Low detection limits and internal control

95°C for 30 mins	20/20	15/20	14/20

With Proteinase K and heat inactivation step

	Concentration (positive replicates)		
	6 copies/ μ L	3 copies/ μ L	1.5 copies/ μ L
65°C for 15 mins	20/20	17/20	15/20
95°C for 30 mins	20/20	16/20	19/20

Table 2. Parallel Testing of Anterior Nares/Oropharyngeal Swabs and Saliva from NBA Players, Staff, and Contractors

		Quest/BioReference	
		AN/OP Swab	
		Positive	Negative
SalivaDirect Saliva	positive	17	2
	negative	2	3,746
	invalid	0	12
Total		19	3,760

Invalid samples = 0.3% (12/3,779). Positive agreement = 89.5% (17/19). Negative agreement = 99.9% (3,746/3,748 valid samples). Overall agreement = 99.9% (3,763/3,767 valid samples).

3,779 paired samples

Invalid rate = 0.3%

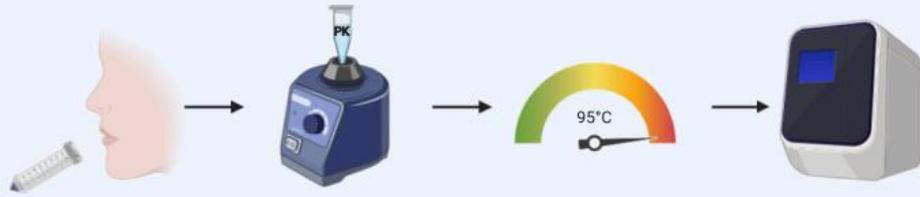

False positive = 0.03-0.05%

Key points:

- Protocol, not a test kit, no commercialization
 - We make no profit: no licensing fees, no commission or royalties.
 - Authorize CLIA-certified labs
 - EUA updates extend to all authorized labs
-
- Growing network of testing labs nationwide
 - Reduce testing costs
 - Reduce implementation time to use saliva
 - Increase the number of tests in the community

Simplified testing framework

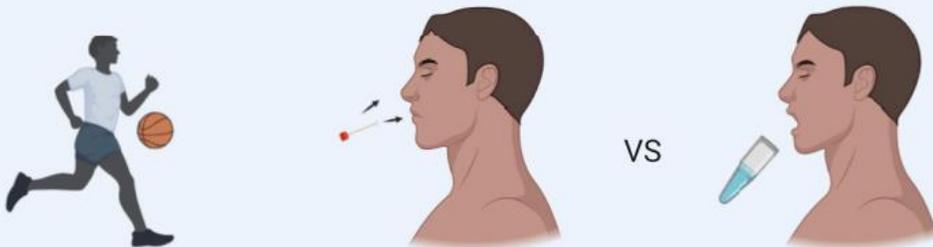

SalivaDirect

Clinical validation

94% positive agreement

Healthy population screening

99.5% negative agreement
