

Revised Birth and Fertility Rates for the United States, 2000 and 2001

by Stephanie J. Ventura, M.A.; Brady E. Hamilton, Ph.D.;
and Paul D. Sutton, Ph.D., Division of Vital Statistics

Abstract

Objectives—This report presents revised birth and fertility rates for 2000 and 2001, based on populations consistent with the April 1, 2000, census. Rates are presented by age, race, and Hispanic origin of mother; by age, race, and Hispanic origin of mother for unmarried women; and by age and race of father. To put the rates for 2000 and 2001 into context, rates are also shown for 1990.

Methods—Populations were produced for the Centers for Disease Control and Prevention's National Center for Health Statistics under a collaborative arrangement with the U.S. Census Bureau. The populations reflect the results of the 2000 census. This census allowed people to report more than one race for themselves and their household members, and also separated the category for Asian or Pacific Islander persons into two groups (Asian; Native Hawaiian or Other Pacific Islander). These changes reflected the Office of Management and Budget's 1997 revisions to the standards for the classification of Federal data on race and ethnicity. Because only one race is currently reported in birth certificate data, the 2000 census populations were "bridged" to the single race categories specified in the Office of Management and Budget's 1977 guidelines for race and ethnic statistics in Federal reporting, which are still in use in the collection of vital statistics data.

Results—Population-based birth and fertility rates for 2000 and 2001, based on the 2000 census, are somewhat lower for Hispanics (11 percent for the fertility rate in 2001) and Asian or Pacific Islanders (7 percent) and considerably lower for American Indians (18 percent) than the rates previously published based on populations projected from the 1990 census. Rates for most other population subgroups differ little from those previously published. Because of these patterns, the differentials in fertility among population subgroups remain, but are somewhat reduced. Between 1990 and 2001, teenage birth rates declined, rates for women in their twenties changed little, and rates for women in their thirties and forties rose.

Introduction

This report presents birth and fertility rates for the United States for 2000 and 2001, based on 2000 census level populations for 2000 and postcensal estimates for 2001, which have recently been produced for the Centers for Disease Control and Prevention's National Center for Health Statistics under a collaborative arrangement with the U.S. Census Bureau (1–3). Previously published birth and fertility rates for 2000 and 2001 were based on population estimates projected from the 1990 census because detailed populations based on the 2000 census were not available when the earlier reports were prepared (4,5).

The revised birth and fertility rates in this report include rates by race and Hispanic origin, by age of mother, and by age of father for 2000 and 2001. Rates for unmarried women are also presented. The focus of the current report is to provide accurate levels of birth and fertility rates for 2000 and 2001. To place the revised rates in context and to provide an overall indication of the trends over the last decade, rates for the same population groups for 1990 are also shown. A subsequent report now in preparation will show revised birth and fertility rates for the intercensal years, 1991–99, along with the rates for 2000 and 2001 shown in this report, and will review the impact of the revised populations on variations in trends and differentials for population subgroups. The forthcoming report will also include revised rates for Hispanic subgroups (Mexican, Cuban, Puerto Rican, and other Hispanic) for 1991 through 2001, as well as revised rates for States.

When the earlier reports were published, it was noted that the rates in those reports were generally larger than would be the case if 2000 census-based estimates were used (4,5). The magnitude of the

Acknowledgments

This report was prepared in the Reproductive Statistics Branch of the Division of Vital Statistics. The report was edited by Demarius V. Miller, typeset by Jacqueline M. Davis, and graphics were produced by Jarmila G. Ogburn of the Publications Branch, Division of Data Services.

overestimates varies by population subgroup, but the overestimates are particularly large for Hispanic and American Indian population groups (6–8). For example, the fertility rate for 2001 for Hispanic women in the originally published report (based on the 1990 census) is about 11 percent higher than the rate in the current report (projected from the 2000 census). The differences between the 1990- and 2000-based fertility rates are negligible for non-Hispanic white women, but are sizeable for non-Hispanic black women (3 percent in 2001), Asian or Pacific Islander women (API) (7 percent), and American Indian women (18 percent). The overall effect of the revised rates is that the range in rates among population subgroups is somewhat smaller than indicated by the previously published rates, mainly reflecting the lower revised rates for Hispanic women. In addition to these differences by population subgroup, the revised rates by age differ from the originally published rates. The revised rates are notably lower than the originally published rates for women aged 25–29 years. These differences will be discussed in more detail in the forthcoming report.

Methods

Birth and fertility rates shown in this report are based on 100 percent of the birth certificates registered in all States and the District of Columbia. More than 99 percent of births occurring in this country are registered (9). The data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). The VSCP includes all States, the District of Columbia, and the territories. Data for the territories are not included in totals for the United States.

Race and Hispanic origin are reported independently on the birth certificate. In tabulations of birth data by race and Hispanic origin, data for Hispanic persons are not further classified by race because the majority of women of Hispanic origin report themselves as white. Most tables in this report show rates for these categories: white total, non-Hispanic white, black total, non-Hispanic black, American Indian total, Asian or Pacific Islander (API) total, and Hispanic. Rates for American Indian and API populations are not shown separately by Hispanic origin.

The populations used in this report were produced under a collaborative arrangement with the U.S. Census Bureau and are based on the 2000 census counts. Reflecting the new guidelines issued in 1997 by the Office of Management and Budget (OMB), the 2000 census included an option for individuals to report more than one race as appropriate for themselves and household members (10). In addition, the 1997 OMB guidelines called for reporting of Asian persons separately from Native Hawaiians or other Pacific Islanders. In the 1977 OMB guidelines, data for Asian or Pacific Islander persons were collected as a single group (11). Birth certificates currently collect only one race for each parent in the same categories as specified in the 1977 OMB guidelines. In addition, birth certificate data do not report Asians separately from Native Hawaiians or other Pacific Islanders. The birth certificate data by race (the numerators for birth and fertility rates) are thus currently incompatible with the population data collected in the 2000 census (the denominators for the rates). In order to produce revised birth and fertility rates for 2000 and 2001, it was necessary to “bridge” the reported population data for multiple race persons back to single race categories. In addition, the 2000 census counts were modified to be consistent with the 1977 OMB racial categories, that is,

to report the data for Asian persons and Native Hawaiians or other Pacific Islanders as a combined category, Asian or Pacific Islanders, and to reflect age as of the census reference date (12). The procedures used to produce the “bridged” populations are described in separate publications (13,14). It is anticipated that “bridged” population data will be used over the next few years for computing population-based rates. Beginning with births occurring in 2003, some States will be collecting information on multiple race reporting. As States gradually begin to collect data on race according to the 1997 OMB guidelines, it is expected that use of the “bridged” populations can be discontinued.

Readers should keep in mind that the population data used to compile the birth and fertility rates by race and ethnicity shown in this report are based on special estimation procedures. They are not true counts. This is the case even for the 2000 populations that are based on the 2000 census. The estimation procedures used to develop these populations contain some errors. Smaller populations, for example, American Indians, are affected much more than larger populations by this measurement error (13). While the nature and magnitude of these errors is unknown, the potential for error should be kept in mind when evaluating trends and differentials. Over the next several years, additional information will be incorporated in the estimation procedures, possibly resulting in further revisions of the population estimates.

Results

Crude birth rate and general fertility rate

The **crude birth rate** for 2001 was 14.1 births per 1,000 total population, compared with 14.4 in 2000 (**table 1**). The 2001 rate was 16 percent lower than in 1990 and a record low for the Nation.

Rates differ substantially by population subgroup, ranging in 2001 from 11.8 per 1,000 for non-Hispanic white persons to 23.0 for Hispanic persons. In every instance, the rates for 2001 were lower than in 2000 and 1990; the largest declines were measured for non-Hispanic black and American Indian populations.

The **general fertility rate**, which relates births to the number of women in the childbearing ages, was 65.3 per 1,000 women aged 15–44 years in 2001, about 1 percent lower than in 2000, and 8 percent below the 1990 level (70.9) (**table 1 and figure 1**).

Fertility rates also vary considerably by race and Hispanic origin. In 2001, the rates ranged from 57.7 for non-Hispanic white women to 96.0 for Hispanic women. Except for Hispanic women, the rates for 2001 were lower than in 2000. Rates for all population groups in 2001 were lower than in 1990, with the largest changes over the decade again reported for non-Hispanic black and American Indian women.

Age of mother

Teenagers—Birth rates for teenagers were at historic low levels in 2001. The overall rate was 45.3 births per 1,000 women aged 15–19 years, down 5 percent from 2000 (47.7) and 24 percent lower than in 1990 (59.9) (**tables 2–4 and figure 2**). Rates in 2001 were lower than in 2000 and lower than in 1990 for every population group.

The rate for the **youngest teenagers, 10–14 years**, was 0.8 per 1,000 in 2001 compared with 0.9 in 2000 and 1.4 in 1990. The **birth rate for teenagers 15–17 years** also fell in 2001, to 24.7 per 1,000, 8 percent lower than in 2000 and 34 percent lower than in 1990 (37.5). The **birth rate for older teenagers 18–19 years** declined as well in 2001, to 76.1 per 1,000, down 3 percent from 2000 and 14 percent from 1990.

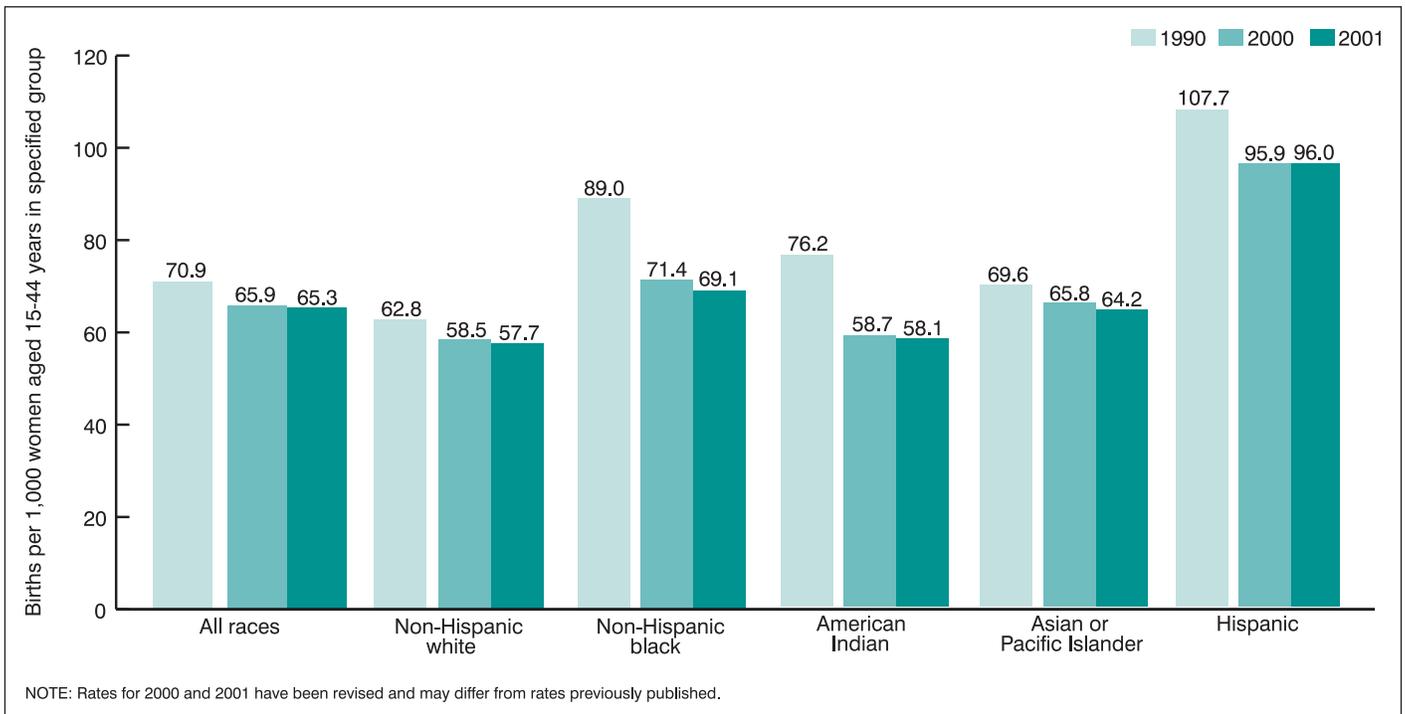

Figure 1. Fertility rates by race and Hispanic origin of mother: United States, 1990, 2000, and 2001

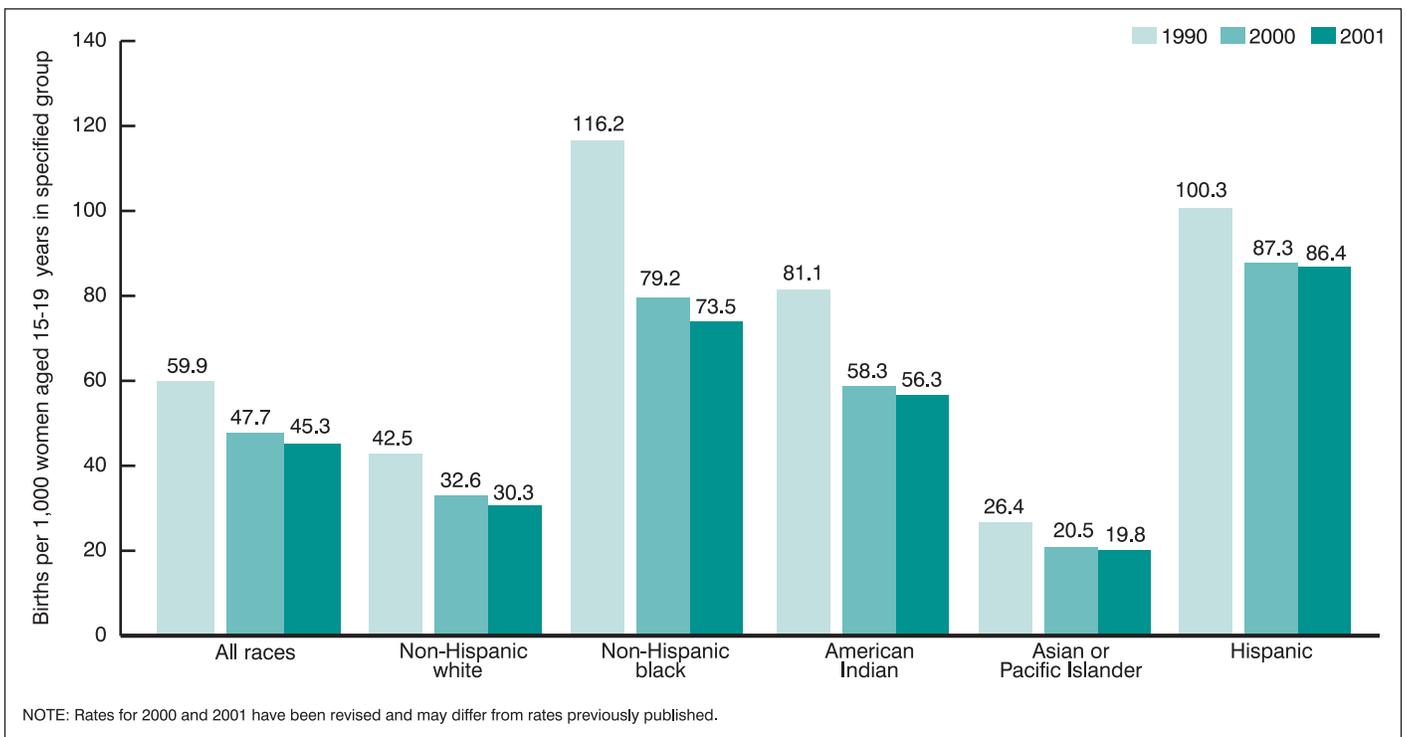

Figure 2. Birth rates for teenagers 15-19 years, by race and Hispanic origin: United States, 1990, 2000, and 2001

The range in teenage birth rates by population subgroup is considerable, from 19.8 per 1,000 for Asian or Pacific Islander (API) teenagers 15–19 years to 86.4 for Hispanic teenagers. The rate for non-Hispanic black teenagers fell 37 percent from 1990 to 2001, whereas the rates for non-Hispanic white, American Indian, and API teenagers fell 25 to 31 percent each. The rate for Hispanic teenagers dropped 14 percent.

Women in their twenties—Women in their twenties historically account for the largest share of all births although the share has declined in recent years, from 57 percent in 1990 to 52 percent in 2001 (frequency data shown in [table 2](#)). The **birth rate for women aged 20–24 years** was 106.2 per 1,000 in 2001, down 3 percent from 2000, and 9 percent from 1990. The **birth rate for women aged 25–29 years** was 113.4 per 1,000 in 2001, essentially unchanged from 2000, but 6 percent lower than in 1990 (120.2).

Women in their thirties—The **birth rate for women aged 30–34 years** was 91.9 per 1,000 in 2001, 1 percent higher than in 2000, and 14 percent above the 1990 level (80.8). The pace of increase in this rate has slowed, from about 3 percent per year during 1975–90 (5) to just over 1 percent per year for 1990–2001.

The **birth rate for women aged 35–39 years** also increased in 2001, to 40.6 per 1,000, up 2 percent from 2000, and up 28 percent compared with 1990. Compared with increases of 4 percent annually during 1978–90 (5), the pace of increase slowed to about 2 percent per year during 1990–2001.

Women in their forties—The **birth rate for women aged 40–44 years** was 8.1 per 1,000 in 2001, 47 percent higher than in 1990, which was 5.5 per 1,000. The **birth rate for women aged 45–49 years** in 2000 and 2001, 0.5 per 1,000, was more than double the 1990 rate, 0.2.

Live-birth order

Revised birth rates for 2000 and 2001 by age of mother and live-birth order, by race and Hispanic origin are shown in [tables 3 and 4](#). The **first birth rate** was 26.0 first births per 1,000 women aged 15–44 years, down from 26.5 in 2000 and 29.0 in 1990. Declines in first birth rates from 1990 were particularly large for teenagers (21 percent) (15). Rates for women in their twenties declined between 1990 and 2001, by 11 percent for ages 20–24 years, and 8 percent for ages 25–29 years. In contrast first birth rates have risen substantially for women in their thirties and forties, increasing 25 percent for women aged 30–34 years, 36 percent for women aged 35–39 years, and 70 percent for women aged 40–44 years.

Changes for second and higher order birth rates were more modest. Second order birth rates declined 7 percent between 1990 (22.8 per 1,000) and 2001 (21.3). Rates for third through sixth–seventh birth orders were each 4 to 10 percent lower in 2001 compared with 1990. There was no change in the rate for eighth and higher order births.

Total fertility rate

The total fertility rate (TFR) shows the potential impact of current fertility patterns on completed family size. The TFR indicates the number of births that a hypothetical group of 1,000 women would have if they experienced throughout their childbearing years the age-specific birth rates observed in a given year. Because it is

computed from age-specific birth rates, the TFR is age adjusted; it is not affected by changes over time in age composition.

The **TFR in 2001** was 2,034.0 per 1,000 women or 2.0 births per woman, down slightly from 2000 (2,056.0) and 2 percent lower than in 1990 (2,081.0) ([table 1 and figure 3](#)). The overall TFR for 2001 as in 2000 was below “replacement” (2.1 per woman). The “replacement” rate is considered the value at which a given generation can exactly replace itself. As is the case for other measures of fertility, the TFR differs substantially by race and Hispanic origin. Rates per woman in 2001 ranged from 1.7 for American Indians to 2.7 for Hispanics. Rates for population subgroups were at or above “replacement” for non-Hispanic black women (2.1) and Hispanic women.

Birth rates for unmarried women

The **birth rate for unmarried women** in 2001 was 43.8 births per 1,000 aged 15–44 years, slightly lower than in 2000 (44.0) and unchanged from 1990 ([table 5 and figure 4](#)). Rates by age of mother were lower in 2001 than in 2000 for unmarried teenagers and women aged 20–24 years; rates for unmarried women aged 25 years and over increased. Compared with 1990, rates for unmarried women in age groups 20–24 years and over were notably higher in 2001; the rate for young unmarried teenagers 15–17 years was 26 percent lower in 2001 than in 1990.

Birth rates for unmarried women by race and Hispanic origin differ considerably. The rate for Asian or Pacific Islander women is the lowest, 21.2 per 1,000 in 2001, reflecting substantially lower rates by age for women under 30 years. Rates are successively higher for unmarried non-Hispanic white women (27.5), black women (68.2), and Hispanic women (87.8). The rate for unmarried black women in 2001 was 25 percent lower than in 1990, while the rate for Hispanic women was 2 percent lower; the rate for non-Hispanic white women was 13 percent higher in 2001 compared with 1990.

Birth rates by age of father

The **birth rate per 1,000 men aged 15–54 years** declined in 2001 to 49.0, 2 percent lower than in 2000 (50.0), and 16 percent lower than in 1990 (58.4). Compared with 1990, birth rates in 2001 were lower for men in age groups under 30 years and 45 years and over and higher in age groups 30–44 years. Birth rates for white and black men in 2001 were lower than in 2000 and in 1990. Rates for black men by age were substantially lower in 2001 compared with 1990, especially among men under age 30 years.

Information on age of father is often missing on birth certificates of children born to unmarried women, especially those under age 25 years (16). In 2001 the father’s age was not reported for 13 percent of all births, 38 percent of all nonmarital births, and 24 percent of all births to women under age 25 years. In order to compute birth rates by age of father, births where age of father is not stated are distributed in the same proportion as births where age of father is reported, within each 5-year age of mother interval. This procedure avoids the distortion in rates that would result if the relationship between age of mother and age of father were disregarded. The procedures for computing birth rates by age of father are described in more detail in the Technical Notes of “Births: Final Data for 2001” (5).

2001	200,279	16.4	64.2	1,840.0
2000	200,543	17.1	65.8	1,892.0
1990	141,635	19.0	69.6	2,002.5
Hispanic^{3,5}				
2001	851,851	23.0	96.0	2,748.5
2000	815,868	23.1	95.9	2,730.0
1990	595,073	26.7	107.7	2,959.5

¹For 1990, includes births to races not shown separately.

²Race and Hispanic origin are reported separately on the birth certificate. Data for persons of Hispanic origin are also included in the data for each race group according to the mother's reported race; see references 5 and 9.

³Birth rates for 1990 exclude data for New Hampshire and Oklahoma, which did not report Hispanic origin.

⁴Includes births to Aleuts and Eskimos.

⁵Includes all persons of Hispanic origin of any race; see references 5 and 9.

Table 2. Births and birth rates, by age, race and Hispanic origin of mother: United States, 1990, 2000, and 2001

[Rates are per 1,000 women in specified group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for 2001. Rates for 2000 and 2001 have been revised for this report and may differ from final birth rates previously published]

Age, race, and Hispanic origin of mother	2001		2000		1990

* Figure does not meet standards of reliability or precision; based on fewer than 20 births.

¹The total number includes births to women of all ages, 10–54 years. The rate shown for all ages is the fertility rate, which is defined as the total number of births, regardless of age of mother, per 1,000 women aged 15–44 years. The total numbers for 1990 include births to women of other races, not shown separately.

²The number of births shown for 2000 and 2001 is the total for women aged 45–54 years; the number for 1990 is the total for women aged 45–49 years. Birth rates for 2000 and 2001 are computed by relating the number of births to women aged 45–54 years to women aged 45–49 years, because most of the births in this group are to women aged 45–49 years.

³Race and Hispanic origin are reported separately on the birth certificate. Data for persons of Hispanic origin are also included in the data for each race group according to the mother's reported race; see references 5 and 9.

⁴Births and birth rates for 1990 exclude data for New Hampshire and Oklahoma, which did not report Hispanic origin.

⁵Includes births to Aleuts and Eskimos.

⁶Includes all persons of Hispanic origin of any race; see references 5 and 9.

Table 3. Fertility rates and birth rates by age of mother, live-birth order, race and Hispanic origin of mother: United States, 2000

[Rates are per 1,000 women in specified age and racial group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates are based on population enumerated in the 2000 census as of April 1. Rates have been revised for this report and may differ from final fertility and birth rates previously published]

* Figure does not meet standards of reliability or precision: based on fewer than 20 births in the numerator.

0.0 Quantity more than zero but less than 0.05.

¹Fertility rates computed by relating total number of births, regardless of age of mother, to women aged 15–44 years.

²Birth rates are computed by relating the number of births to women 45–54 years to women aged 45–49 years, because most of the births in this group are to women aged 45–49.

³Race and Hispanic origin are reported separately on the birth certificate. Data for persons of Hispanic origin are also included in the data for each race group according to the mother's reported race; see references 5 and 9.

⁴Includes births to Aleuts and Eskimos.

⁵Includes all persons of Hispanic origin of any race; see references 5 and 9.

Table 4. Fertility rates and birth rates by age of mother, live-birth order, race and Hispanic origin of mother: United States, 2001

[Rates are per 1,000 women in specified age and racial group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates are based on the 2000 census and estimated as of July 1 for 2001. Rates have been revised for this report and may differ from final fertility and birth rates previously published]

1990	84.9	55.2	158.2	144.9	103.2	60.4	31.1	15.0	7.1	1.4

¹Rates computed by relating total births, regardless of age of father, to men aged 15–54 years.

²Rates computed by relating births of fathers under 20 years of age to men aged 15–19 years.

³Includes races other than white and black.

NOTES: Race and Hispanic origin are reported separately on birth certificates. In this table all men (including Hispanic men) are classified only according to their race; see references 5 and 9. Age of father was not stated for 16 percent of births in 1990 and 14 percent of births in 2000 and 2001.

Technical Notes

Data presented in this report are based on information reported on birth certificates filed for all births in the United States. Data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). Details on the data elements collected in the birth certificate file are discussed in previous reports (4,5,9).

Population denominators

Birth and fertility rates for 2000 and 2001 shown in this report have been revised from those published in "Births: Final Data for 2000" and "Births: Final Data for 2001" (4,5). The rates in this report are based on populations from the 2000 census as of April 1, and projected from the 2000 census for 2001, estimated as of July 1 (tables I and II) (1,2). The population estimates have been produced under a collaborative arrangement with the U.S. Census Bureau (1-3) and are based on the 2000 census counts by age, race, and sex, which were modified to be consistent with Office of Management and Budget racial categories as of 1977 and historical categories for birth data, and in the case of age, to reflect age as of the census reference date. The modification procedures are described in detail elsewhere (12-14).

Currently in preparation are revised population-based rates for the 1990s by age, sex, race, and Hispanic origin. These will be presented in a special report that will also include the revised rates for 2000 and 2001, which are shown in this report. Rates for Hispanic subgroups will also be presented in the forthcoming report, as will rates for States.

Birth rates for unmarried women for 2000 and 2001 shown in table 5 are based on distributions of the population by marital status as of March 2000 and March 2001 provided by the U.S. Census Bureau (17,18), which have been adjusted to July 2000 and July 2001 population levels (1,3) by the Division of Vital Statistics, NCHS (16). The 2000 and 2001 population levels are consistent with the 2000 census.

Computation of rates

In computing birth rates by live-birth order, births with birth order not stated were distributed in the same proportion as births of known live-birth order. This procedure is done separately by race and ethnicity.

In computing birth and fertility rates for the Hispanic population, births with origin of mother not stated are included with non-Hispanic births rather than being distributed. Thus, rates for the U.S. Hispanic population are underestimates of the true rates to the extent that the births with origin of mother not stated (0.6 percent in 2001 and 1.1 percent in 2000) were actually to Hispanic mothers. In computing the rates, the census-based populations with origin not stated are imputed. The effect on the rates is believed to be small.

Table I. Total population and female population by age and race and Hispanic origin: United States, 2000
