National Vital Statistics Reports

Volume 58, Number 4 October 14, 2009

Estimated Pregnancy Rates for the United States, 1990–2005: An Update

by Stephanie J. Ventura, M.A.; Joyce C. Abma, Ph.D.; William D. Mosher, Ph.D., Division of Vital Statistics; and Stanley K. Henshaw, Ph.D., The Guttmacher Institute

Abstract

Objectives—This report presents detailed pregnancy rates for 1990–2005, updating a national series of rates extending since 1976.

Methods—Tabular data on pregnancy rates by age, race and Hispanic origin, and by marital status are presented and briefly described.

Results—In 2005, an estimated 6,408,000 pregnancies resulted in 4.14 million live births, 1.21 million induced abortions, and 1.06 million fetal losses. The 2005 pregnancy rate of 103.2 pregnancies per 1,000 women aged 15–44 years is 11 percent below the 1990 peak of 115.8. The teenage pregnancy rate dropped 40 percent from 1990 to 2005, reaching an historic low of 70.6 per 1,000 women aged 15–19 years. Rates fell much more for younger than for older teenagers.

Keywords: pregnancy rates • teenage pregnancy • birth

Introduction

This report presents pregnancy rates for 1990-2005, by age, race and Hispanic origin, and by marital status. The data in this report, together with previously published pregnancy rates for earlier years, provide a consistent series of rates for the United States for 1976–2005 (1,2). This update contains new data on pregnancy rates for the year 2005, the most recent year for which detailed national estimates for abortions are available. All rates in this report use postcensal population estimates that are based on the 2000 census (3). Rates are presented for pregnancy outcomes, and by age, race, and Hispanic origin (Tables 1-4), and by marital status, race and Hispanic origin (Table 5). Selected findings are illustrated in Figures 1-4. The statistics for live births are based on complete counts of births provided by every state to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program of the National Vital Statistics System. Abortion estimates are from abortion surveillance information collected from most states by the Centers for Disease Control and Prevention's (CDC) National Center

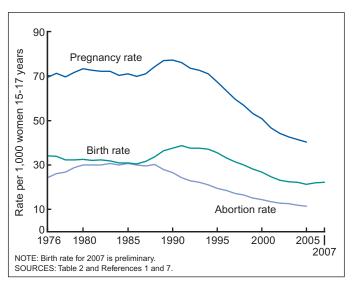

Figure 1. Pregnancy, birth, and abortion rates for teenagers 15–17 years: United States

for Chronic Disease Prevention and Health Promotion (NCCDPHP); these estimates are adjusted to national totals by the Guttmacher Institute (4,5). The CDC's NCCDPHP collects information on the characteristics of women (age, race and Hispanic origin, and marital status) who obtain abortions based on information reported by 46 states, New York City, and the District of Columbia. The Guttmacher Institute's *national* totals are distributed by these characteristics. Fetal loss rates are derived from the pregnancy history data collected from several cycles of the National Survey of Family Growth conducted by NCHS (6). Details of sources and methods of estimation are presented in earlier reports (1,2).

Overview of findings

 An estimated 6,408,000 pregnancies ended in 2005, slightly more than in 2004, and about 6 percent fewer than the historic 1990 peak (6,786,000) for the period 1976–2005.

- The 2005 total includes 4.14 million live births, 1.21 million induced abortions, and 1.06 million fetal losses.
- The estimated pregnancy rate for 2005 was 103.2, about 11 percent below the 1990 peak (115.8 per 1,000 women aged 15–44 years), but very similar to the rate of 102.7 when the series began in 1976 (Table 1).
- The pregnancy rate for teenagers fell 40 percent during the 1990–2005 period, to 70.6 pregnancies per 1,000 women aged 15–19 years. (Table 2). This rate was the lowest reported since 1976 (2).
- The overall decline for teenagers is reflected in significant declines in rates for live births and induced abortions, with much steeper declines for abortions (down 53 percent) compared with live births (down 32 percent).
- The pregnancy rate declined much more rapidly from 1990 to 2005 for younger teenagers 15–17 years (48 percent) than for older teenagers 18–19 years (30 percent) (Figures 1 and 2).
- Pregnancy rates declined by 47–49 percent each for black and white non-Hispanic teenagers and by 23 percent for Hispanic teenagers (Table 2).
- Preliminary data on births extending to 2007 show that the long-term decline in the teenage birth rate was halted with increases from 2005 to 2006 and from 2006 to 2007 (7). When more recent abortion estimates become available, it will be possible to assess whether and to what extent teenage *pregnancy* rates have increased as the *birth* rate did.
- Pregnancy rates by age of woman are highest in 1990 and 2005 for women in their twenties, intermediate at ages 18–19 and 30–34 years, and lowest at ages under 18 and 35 years and older (Figure 3).
- During the period 1990–2005, pregnancy rates for married women fell 8 percent while the rate for unmarried women declined 11 percent (Table 5 and Figure 4).
- The birth rate for married women declined 9 percent from 1990 to 1999, and has since changed little; the abortion rate, however, dropped more than one-third during the 1990–2005 period. The birth rate for unmarried women changed little during 1990–2002,

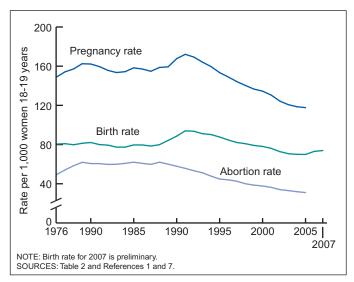

Figure 2. Pregnancy, birth, and abortion rates for teenagers 18–19 years: United States

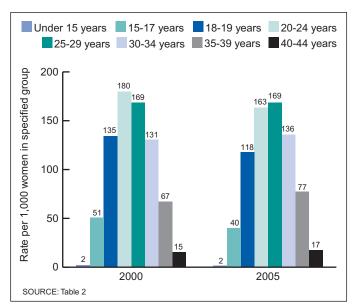

Figure 3. Pregnancy rates, by age of woman: United States, 2000 and 2005

and has since risen considerably (8). The abortion rate, however, declined through the entire period, by 35 percent overall.

Findings from the 2006–2008 continuous National Survey of Family Growth (available early in 2010; see http://www.cdc.gov/nchs/nsfg.htm) are expected to help explain the trends and variations in pregnancy rates and the factors that account for them.

¹Spontaneous fetal losses from recognized pregnancies of all gestational periods as reported by women in the 1982, 1988, 1995, and 2002 National Surveys of Family Growth conducted by the National Center for Health Statistics. The rate of pregnancy loss depends on the degree to which losses at very early gestations are detected.

NOTES: Due to rounding, numbers may not add to totals. For information on sources and methods of estimation, see References 1 and 2.

²Rates computed by relating the number of events to women of all ages to women aged 15-44 years.

¹Rates computed by relating the number of events to women of all ages to women aged 15-44 years.

NOTES: Due to sample size limitations in any given year, fetal loss rates for teenagers for 1990-2005 are based on cycles 3 through 6 of the National Surveys of Family Growth (conducted 1982, 1988, 1995, and 2002). For information on sources and methods of estimation, see References 1 and 2.

²Rates computed by relating the number of events to women under age 15 years to women aged 10-14 years.

³Rates computed by relating the number of events to women aged 40 years and over to women aged 40-44 years.

⁴Includes races other than white and black and origin not stated.

⁵Spontaneous fetal losses from recognized pregnancies of all gestational periods as estimated from reports from women in the 1995 and 2002 National Surveys of Family Growth conducted by the National Center for Health Statistics. The rate of fetal loss depends on the degree to which losses at very early gestations are detected. See References 1 and 2 for more information.

⁶Includes all persons of Hispanic origin of any race.

Table 3. Number and percent distribution of pregnancies, by outcome of pregnancy, by age, and by race and Hispanic origin of women: United States, 2005

¹Includes races other than white and black and origin not stated.

²Spontaneous fetal losses from recognized pregnancies of all gestational periods as estimated from reports from women in the 1995 and 2002 National Surveys of Family Growth conducted by the National Center for Health Statistics. The rate of fetal loss depends on the degree to which losses at very early gestations are detected. See References 1 and 2 for more information.

³Includes all persons of Hispanic origin of any race.

NOTES: Due to rounding, numbers may not add to totals. Percent distributions are based on unrounded frequencies. Due to sample size limitations in any given year, fetal loss proportions for teenagers for 2005 are based on cycles 3 through 6 of the National Survey of Family Growth (conducted 1982, 1988, 1995, and 2002). For information on sources and methods of estimation, see References 1

Table 4. Estimated total pregnancy, total fertility, and total induced abortion rates, by race and Hispanic origin: United States, 1990, 1996, 2000, 2003, 2004, and 2005

[Rates are sums of rates for 5-year age groups (in Table 2) multipled by 5 and divided by 1,000]

	Pregnancy measure

Hispanic ³	0.77	0.81	0.83	0.87	0.91	0.97						

¹Includes estimates of fetal losses not shown separately.

NOTES: Total pregnancy rates are estimates of the number of pregnancies a woman would have if she experiences the age-specific pregnancy rates observed in a given year throughout her reproductive years. Total fertility rates are estimates of the number of live births a woman would have if she experiences the age-specific birth rates observed in a given year throughout her reproductive years. Total abortion rates are estimates of the number of abortions a woman would have if she experiences the age-specific abortion rates observed in a given year throughout her reproductive years. For information on sources and methods of estimation, see References 1 and 2.

²Includes races other than white and black and origin not stated.

³Includes all persons of Hispanic origin of any race.

Table 5. Pregnancy, live birth, and induced abortion rates, by marital status and race and Hispanic origin: United States, 1990–2005

1993	152.4	113.0	16.4	22.9	170.6	91.4	60.6	18.5

 $^{^{\}rm 1} Includes$ all persons of Hispanic origin of any race.

NOTES: Marital status is the woman's marital status as of the date the pregnancy ended, rather than at the time of conception. Figures for married women include pregnancies for separated women. For information on sources and methods of estimation, see References 1 and 2. Pregnancy rates for unmarried Hispanic and black women are available beginning 1993 when estimates of abortions became available. Rates for unmarried non-Hispanic white women are available beginning 1994 when population estimates by marital status became available. Rates for unmarried non-Hispanic black women are not available because the necessary population estimates are not available.
