Macronutrients

1. Energy intake in kilocalories by sex, age, and race/ethnicity: United States, 1988–94	8
2. Energy intake in kilocalories by sex, age, and income level: United States, 1988–94	9
3. Carbohydrate intake in grams by sex, age, and race/ethnicity: United States, 1988–94	10
4. Carbohydrate intake in grams by sex, age, and income level: United States, 1988–94	11
5. Protein intake in grams by sex, age, and race/ethnicity: United States, 1988–94	12
6. Protein intake in grams by sex, age, and income level: United States, 1988–94	13
7. Alcohol intake in grams by sex, age, and race/ethnicity: United States, 1988–94	14
8. Alcohol intake in grams by sex, age, and income level: United States, 1988–94	15
9. Total fat intake in grams by sex, age, and race/ethnicity: United States, 1988–94	16
10. Total fat intake in grams by sex, age, and income level: United States, 1988–94	17
11. Saturated fat intake in grams by sex, age, and race/ethnicity: United States, 1988–94	18
12. Saturated fat intake in grams by sex, age, and income level: United States, 1988–94	19
13. Monounsaturated fat intake in grams by sex, age, and race/ethnicity: United States, 1988–94	20
14. Monounsaturated fat intake in grams by sex, age, and income level: United States, 1988–94	21
15. Polyunsaturated fat intake in grams by sex, age, and race/ethnicity: United States, 1988–94	22
16. Polyunsaturated fat intake in grams by sex, age, and income level: United States, 1988–94	23
17. Cholesterol intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	24
18. Cholesterol intake in milligrams by sex, age, and income level: United States, 1988–94	25
19. Percent of calories from carbohydrate by sex, age, and race/ethnicity: United States, 1988–94	26

20.	Percent of calories from carbohydrate by sex, age, and income level: United States, 1988–94	27
21.	Percent of calories from protein by sex, age, and race/ethnicity: United States, 1988–94	28
22.	Percent of calories from protein by sex, age, and income level: United States, 1988–94	29
23.	Percent of calories from alcohol by sex, age, and race/ethnicity: United States, 1988–94	30
24.	Percent of calories from alcohol by sex, age, and income level: United States, 1988–94	31
25.	Percent of calories from total fat by sex, age, and race/ethnicity: United States, 1988–94	32
26.	Percent of calories from total fat by sex, age, and income level: United States, 1988–94	33
27.	Percent of calories from saturated fat by sex, age, and race/ethnicity: United States, 1988–94	34
28.	Percent of calories from saturated fat by sex, age, and income level: United States, 1988–94	35
29.	Percent of calories from monounsaturated fat by sex, age, and race/ethnicity: United States, 1988–94	36
30.	Percent of calories from monounsaturated fat by sex, age, and income level: United States, 1988–94	37
31.	Percent of calories from polyunsaturated fat by sex, age, and race/ethnicity: United States, 1988–94	38
32.	Percent of calories from polyunsaturated fat by sex, age, and income level: United States, 1988–94	39

Vitamins

33.	Vitamin B ₆ intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	40
34.	Vitamin B ₆ intake in milligrams by sex, age, and income level: United States, 1988–94	41
35.	Vitamin B ₁₂ intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	42
36.	Vitamin B ₁₂ intake in micrograms by sex, age, and income level: United States, 1988–94	43
37.	Vitamin C intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	44
38.	Vitamin C intake in milligrams by sex, age, and income level: United States, 1988–94	45
39.	Vitamin E intake in milligrams alpha-tocopherol equivalents by sex, age, and race/ethnicity: United States, 1988–94	46
40.	Vitamin E intake in milligrams alpha-tocopherol equivalents by sex, age, and income level: United States, 1988–94	47
41.	Folate intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	48

Macronutrients and Other Dietary Components

67.	Total fat intake in grams by sex, age, and race/ethnicity: United States, 1988–94	74
68.	Total fat intake in grams by sex, age, and income level: United States, 1988–94	75
69.	Saturated fat intake in grams by sex, age, and race/ethnicity: United States, 1988–94	76
70.	Saturated fat intake in grams by sex, age, and income level: United States, 1988–94	77
71.	Monounsaturated fat intake in grams by sex, age, and race/ethnicity: United States, 1988–94	78
72.	Monounsaturated fat intake in grams by sex, age, and income level: United States, 1988–94	79
73.	Polyunsaturated fat intake in grams by sex, age, and race/ethnicity: United States, 1988–94	80
74.	Polyunsaturated fat intake in grams by sex, age, and income level: United States, 1988–94	81
75.	Linolenic acid (PFA 18:3) intake in grams by sex, age, and race/ethnicity: United States, 1988–94	82
76.	Linolenic acid (PFA 18:3) intake in grams by sex, age, and income level: United States, 1988–94	83
77.	Total trans-fatty acid intake in grams by sex, age, and race/ethnicity: United States, 1988–94	84
78.	Total trans-fatty acid intake in grams by sex, age, and income level: United States, 1988–94	85
79.	Polyunsaturated fatty acid (PFA) 20:5 intake in grams by sex, age, and race/ethnicity: United States, 1988–94	86
80.	Polyunsaturated fatty acid (PFA) 20:5 intake in grams by sex, age, and income level: United States, 1988–94	87
81.	Polyunsaturated fatty acid (PFA) 22:6 intake in grams by sex, age, and race/ethnicity: United States, 1988–94	88
82.	Polyunsaturated fatty acid (PFA) 22:6 intake in grams by sex, age, and income level: United States, 1988–94	89
83.	Animal protein intake in grams by sex, age, and race/ethnicity: United States, 1988–94	90
84.	Animal protein intake in grams by sex, age, and income level: United States, 1988–94	91
85.	Vegetable protein intake in grams by sex, age, and race/ethnicity: United States, 1988–94	92
86.	Vegetable protein intake in grams by sex, age, and income level: United States, 1988–94	93
87.	Oxalic acid intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	94
88.	Oxalic acid intake in milligrams by sex, age, and income level: United States, 1988–94	95
89.	Phytic acid intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	96
90.	Phytic acid intake in milligrams by sex, age, and income level: United States, 1988–94	97

Vitamins and minerals

91.	Total vitamin A intake in International Units (IU) by sex, age, and race/ethnicity: United States, 1988–94	98
92.	Total vitamin A intake in International Units (IU) by sex, age, and income level: United States, 1988–94	99
93.	Vitamin D intake micrograms by sex, age, and race/ethnicity: United States, 1988–94	100
94.	Vitamin D intake micrograms by sex, age, and income level: United States, 1988–94	101
95.	Vitamin K intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	102
96.	Vitamin K intake in micrograms by sex, age, and income level: United States, 1988–94	103
97.	Selenium intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	104
98.	Selenium intake in micrograms by sex, age, and income level: United States, 1988–94	105

Sugars and Artificial Sweeteners

99.	Aspartame intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	106
100.	Aspartame intake in milligrams by sex, age, and income level: United States, 1988–94	107
101.	Fructose intake in grams by sex, age, and race/ethnicity: United States, 1988–94	108
102.	Fructose intake in grams by sex, age, and income level: United States, 1988–94	109
103.	Galactose intake in grams by sex, age, and race/ethnicity: United States, 1988–94	110
104.	Galactose intake in grams by sex, age, and income level: United States, 1988–94	111
105.	Glucose intake in grams by sex, age, and race/ethnicity: United States, 1988–94	112
106.	Glucose intake in grams by sex, age, and income level: United States, 1988–94	113
107.	Lactose intake in grams by sex, age, and race/ethnicity: United States, 1988–94	114
108.	Lactose intake in grams by sex, age, and income level: United States, 1988–94	115
109.	Maltose intake in grams by sex, age, and race/ethnicity: United States, 1988–94	116
110.	Maltose intake in grams by sex, age, and income level: United States, 1988–94	117
111.	Saccharin intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	118
112.	Saccharin intake in milligrams by sex, age, and income level: United States, 1988–94	119
113.	Sucrose intake in grams by sex, age, and race/ethnicity: United States, 1988–94	120
114.	Sucrose intake in grams by sex, age, and income level: United States, 1988–94	121

Carotenoids, Individual Trans fatty acids, Other Nutrients and Substances

115.	Alpha-Carotene intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	122
116.	Alpha-Carotene intake in micrograms by sex, age, and income level: United States, 1988–94	123
117.	Beta-Carotene intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	124
118.	Beta-Carotene intake in micrograms by sex, age, and income level: United States, 1988–94	125
119.	Beta-Carotene equivalents in micrograms by sex, age, and race/ethnicity: United States, 1988–94	126
120.	Beta-Carotene equivalents in micrograms by sex, age, and income level: United States, 1988–94	127
121.	Beta-Cryptoxanthin intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	128
122.	Beta-Cryptoxanthin intake in micrograms by sex, age, and income level: United States, 1988–94	129
123.	Lutein/Zeaxanthin intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	130
124.	Lutein/Zeaxanthin intake in micrograms by sex, age, and income level: United States, 1988–94	131
125.	Lycopene intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	132
126.	Lycopene intake in micrograms by sex, age, and income level: United States, 1988–94	133
127.	Retinol intake in micrograms by sex, age, and race/ethnicity: United States, 1988–94	134
128.	Retinol intake in micrograms by sex, age, and income level: United States, 1988–94	135
129.	Caffeine intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	136
130.	Caffeine intake in milligrams by sex, age, and income level: United States, 1988–94	137
131.	Crude fiber intake in grams by sex, age, and race/ethnicity: United States, 1988–94	138
132.	Crude fiber intake in grams by sex, age, and income level: United States, 1988–94	139
133.	Water insoluble dietary fiber in grams by sex, age, and race/ethnicity: United States, 1988–94	140
134.	Water insoluble dietary fiber in grams by sex, age, and income level: United States, 1988–94	141
135.	Water soluble dietary fiber in grams by sex, age, and race/ethnicity: United States, 1988–94	142
136.	Water soluble dietary fiber in grams by sex, age, and income level: United States, 1988–94	143
137.	Pectin intake in grams by sex, age, and race/ethnicity: United States, 1988–94	144
138.	Pectin intake in grams by sex, age, and income level: United States, 1988–94	145
139.	Starch intake in grams by sex, age, and race/ethnicity: United States, 1988–94	146
140.	Starch intake in grams by sex, age, and income level: United States, 1988–94	147
141.	3-Methylhistidine intake in milligrams by sex, age, and race/ethnicity: United States, 1988–94	148
142.	3-Methylhistidine intake in milligrams by sex, age, and income level: United States, 1988–94	149
143.	Trans fatty acid (16:1) intake in grams by sex, age, and race/ethnicity: United States, 1988–94	150
144.	Trans fatty acid (16:1) intake in grams by sex, age, and income level: United States, 1988–94	151
145.	Trans fatty acid (18:1) intake in grams by sex, age, and race/ethnicity: United States, 1988–94	152
146.	Trans fatty acid (18:1) intake in grams by sex, age, and income level: United States, 1988–94	153
147.	Trans fatty acid (18:2) intake in grams by sex, age, and race/ethnicity: United States, 1988–94	154
148.	Trans fatty acid (18:2) intake in grams by sex, age, and income level: United States, 1988–94	155

Abstract

Objectives

This report presents national estimates of dietary intakes of macronutrients, micronutrients, and other dietary constituents for persons 2 months and older, by sociodemographic variables.

Methods

The third National Health and Nutrition Examination Survey (NHANES III) (1988–94), the source of these data, was designed to provide information on the health and nutritional status of the civilian noninstitutionalized U.S. population. The analytic sample for these analyses included 29,105 participants with complete and reliable dietary recalls.

Results

This report provides mean, median, and standard error of the mean dietary intake data for the U.S. population, 1988–94. Dietary intake estimates were derived from NHANES III 24-hour recall data. Foods reported during the survey were coded using the U.S. Department of Agriculture (USDA) Survey Nutrient Database (SNDB) and the University of Minnesota Nutrition Coordinating Center (NCC) data. Food composition values for macronutrients, vitamins, minerals, and other food components are based on SNDB and NCC data.

Conclusions

Data on nutrient intakes are a crucial piece of information toward the determination of total dietary intake. Together with anthropometric and laboratory data, information on nutrient intake can be used to assess nutritional status and elucidate the relationship between nutrition and health.

Keywords: *nutrient intake • 24-hour dietary recall • NHANES III • nutritional status*

Dietary Intake of Macronutrients, Micronutrients, and Other Dietary Constituents: United States 1988–94

Karil Bialostosky, M.S.; Jacqueline D. Wright, M.P.H.; Jocelyn Kennedy-Stephenson, M.S.; Margaret McDowell, M.P.H., R.D.; and Clifford L. Johnson M.S.P.H.; Division of Health Examination Statistics

Introduction

Dietary guidance, food fortification policy, nutrition intervention and evaluation programs, and national nutrition and health policy objectives targeting the American diet require dietary intake data. The link between food and health has been well documented by numerous studies and reports describing the impact of dietary intake on disease prevention and health promotion (1–4). This report on the macronutrient and micronutrient consumption of Americans, including fats, carbohydrates, protein, minerals, vitamins, dietary fiber and other components, is based on information collected from 1988–94 in the third National Health and Nutrition Examination Survey (NHANES III). The survey was conducted by the National Center for Health Statistics (NCHS), Centers for Disease Control and Prevention (CDC).

As a cornerstone of the National Nutrition Monitoring and Related Research Program, the National Health and Nutrition Examination Surveys

(NHANES) are an important source of periodic information on the dietary, nutritional, and health status of the civilian noninstitutionalized U.S. population (5–9). NHANES data play a unique role in nutrition monitoring and epidemiologic research, combining personal dietary interviews with standardized health examinations (8–10). The survey program began in 1960 with three surveys of health status, which were called the National Health Examination Surveys (NHES) (11–13). In 1970, an expanded nutrition component was added to provide data with which to assess nutritional status and dietary practices, and the name was changed to the National Health and Nutrition Examination Survey (14–16). A special survey of three Hispanic subgroups living in the United States was conducted during 1982–1984 (17). The NHANES III is the seventh and most recently completed NHANES.

Although nutrient intake information for numerous nutrients has been reported in the past, this report provides data for the full 6 years of the survey and includes updated national reference data for total vitamin A,

The authors gratefully acknowledge the technical expertise and assistance of Dr. Ronette Briefel in NHANES III planning, monitoring, and reporting findings from the NHANES III dietary assessment component; Ms. Diane Arroyo for her expertise in planning and monitoring data collection activities and interviewer training; and Dr. Catherine Loria for her contributions to the implementation of the data collection protocol, DDC system file design process, and research involving recipes for ethnic foods, particularly foods commonly reported by Mexican Americans. The report was edited by Klaudia M. Cox and typeset by Zung T. N. Le of the Publications Branch, Division of Data Services.

retinol, and total carotenes, as well as information on nutrients and food constituents not previously reported: individual carotenoids, trans fatty acids, 3-methylhistidine, and vitamin K. The nutrient intakes in this file include nutrients from foods and beverages reported in the 24-hour dietary recall, but not those obtained from other sources (i.e., nutritional supplements, antacids, medications, salt and seasonings added to prepared foods at the table, and plain drinking water).

Methods

Source of Data and Survey Design

NHANES III used a stratified, multistage design to provide a representative probability sample of the civilian noninstitutionalized population ages 2 months and older of the United States. The survey was conducted from October 1988 through October 1994, and was designed as two 3-year phases, each constituting a national probability sample. The 6-year sample, also a national probability sample, provides more statistically reliable estimates due to its larger size. Subgroups of the population were oversampled to allow increased precision in estimates for these groups, including black people, Mexican-Americans, children 2 months to 5 years, and persons 60 years and older. A detailed description of sample design specifications is included in the *Plan and Operation of the Third National Health and Nutrition Examination Survey, 1988–1994* (18,19).

The survey included an interview conducted in the household and an examination at a mobile examination center (MEC). Information obtained during the interview included individual characteristics such as sex, age, self-reported race and ethnicity, years of education completed, and household income. The interviewer also asked questions about selected health conditions and behaviors, including information about smoking and use of vitamin or mineral supplements. The examination

consisted of a variety of physical measurements and a phlebotomy.

The MEC examination also included an additional interview in a more private setting than the household to allow for more personal or sensitive questions. The 24-hour recall interview was conducted during the MEC exam. A detailed description of the data collection methods for the survey has been published elsewhere (20).

Response Rates

Table A includes the response rates for the dietary component. Eighty-six percent of respondents completed the interviews and 78 percent of all sample persons completed the health and nutrition examinations. Respondents with incomplete recalls ($n=586$) and breastfeeding infants and children ($n=300$) were excluded from all analyses; 317 persons were not interviewed due to refusals, communication problems, survey operation reasons such as lack of time, or a lack of knowledge by the proxy of what the examinee ate the day before. No attempt was made to impute missing data. The analytic sample is comprised of 29,105 respondents who had complete and reliable recalls. This represents 94 percent of the examined sample (29,105/30,818) or 73 percent of all sample persons (29,105/39,695). Two individuals who fasted are included in the sample.

Dietary Data Collection Methodology

Prior to NHANES III, 24-hour recalls were recorded on hard copy forms and manually coded by dietary interviewers. The NHANES III dietary assessment component was designed with input from experts in the fields of nutrition, public health, biostatistics, and epidemiology to meet the survey's nutrition monitoring and nutrition research objectives (10,18,21,22). The 24-hour recall method was selected for use in NHANES III to estimate detailed quantitative nutrient intake for the population and various subgroups and to study diet-health relationships (8–10,21,22). In 1988, NCHS contracted with the University of Minnesota's Nutrition Coordinating Center (NCC) to develop an automated, interactive dietary interview and coding system called the NHANES III Dietary Data Collection (DDC) system (23–25). NCHS, the National Heart, Lung and Blood Institute of the National Institutes of Health, and the Food and Drug Administration funded the development of the DDC system. The DDC system features include a standardized interview format and automated probes to obtain detailed information about foods such as brand names, food preparation methods, and ingredients used in food preparation, particularly ingredients that contribute fat and sodium.

Table A. Survey response rates for the 24-hour dietary recall component: NHANES III, 1988–94

Response category	Number	Response rate	
		Component	Survey
Total number of sample persons	39,695	...	100
Interviewed sample persons	33,994	...	86
Examined sample persons	30,818	100	78
24-hour dietary recall			
Total interviewed	30,501	99	77
Reliable	29,991	97	76
Complete	29,105	94	73
Nursing infant/child	300	1	...
Incomplete	586	2	...
Unreliable	184	(¹)	...
Computer malfunction	326	(¹)	...
Total not interviewed	317		

¹Category not applicable.

¹Less than 1 percent.

This report provides data for the U.S. population's intake of macronutrients (the primary contributors to energy intake, which include total carbohydrate, total fat, protein, and alcohol) and minerals, vitamins, dietary fiber, and other food components for persons 2 months of age and over. Daily dietary estimates are reported by age and gender for the total population for three race-ethnic groups: non-Hispanic white, non-Hispanic black, and Mexican American, and by income status.

Respondents reported all foods and beverages consumed, except plain drinking water, over the previous 24-hour time period (midnight to midnight). Foods and beverages were quantified using food specific units (e.g., a large-size egg or medium-size apple), abstract food models, shape charts, and measurement aids such as rulers and household measuring cups and spoons.

Dietary interviews were conducted in English (84 percent), Spanish (13 percent), and English/Spanish or other languages (1 percent). The NHANES III Dietary Interviewer's Training Manual provides details for all aspects of the 24-hour recall protocol (20). Dietary interviewers were required to have a college degree in foods and nutrition. A majority of the interviewers were bilingual in English and Spanish.

During the survey, approximately 67 percent of all dietary interviews were completed by the respondent, 28 percent by a proxy respondent, and 3 percent by the respondent and a proxy. Proxy respondents were utilized for infants and children 2 months–5 years and for other respondents who were unable to report on their own. Children 6–11 years of age were permitted to report their own food intake; some interviews in this age group were completed by a proxy or a combination of the child and a proxy. Data retrieval with daycare providers and schools was conducted as necessary to obtain complete intakes for infants and children. All 24-hour recall interviews were conducted in the mobile examination centers (MEC's); the examination schedules included all days of the week. The distribution of day of the week for the 24-hour period (midnight to midnight) in which the

examinee consumed the foods and beverages reported in the 24-hour recall was: Sunday, 9 percent; Monday, 9 percent; Tuesday, 10 percent; Wednesday, 19 percent; Thursday, 18 percent; Friday, 25 percent; and Saturday, 10 percent.

Nutrient Composition Databases

Nutrient composition databases provide detailed information about nutrients and other constituents in food. The U.S. Department of Agriculture (USDA) Nutrient Data Laboratory (NDL) is responsible for providing information on the nutrient content of foods consumed in the United States. NDL develops and maintains a number of different databases including the USDA Nutrient Database for Standard Reference (SR) and the Primary Data Set for USDA Nationwide Food Surveys (PDS). SR and PDS nutrient data are the core data for many domestic and foreign databases, including commercial databases such as the University of Minnesota's Nutrition Coordinating Center (NCC) database. The PDS contains nutrient values for over 3,150 food items including all ingredient items used in USDA survey recipe calculations. The PDS is used to develop the Survey Nutrient Database (SNDB) for the USDA Continuing Survey of Food Intakes by Individuals (CFSII).

The SNDB files have been the primary food and nutrient data source for NHANES since 1982. USDA provided two nutrient composition data files to NCHS (28); separate USDA nutrient composition data files were used to process the NHANES III Phase 1 (1988–91) and Phase 2 (1991–94) dietary data. Each USDA file contained food composition values for approximately 30 nutrients that were appropriate for the time period during which the NHANES III data were collected. NCHS also used data compiled by the University of Minnesota, Nutrition Coordinating Center (NCC), to process the NHANES III dietary files (29). The linkage to the NCC database system made it possible

for NCHS to produce nutrient intake estimates for more than 80 different nutrients and food components. The NCC database included individual sugars and fatty acids, artificial sweeteners, vitamin D, caffeine, and many other food constituents that were not available in the USDA database at the time the NHANES III data were processed. Additionally, NCC maintains an extensive database of commercial food products including commercial table fats and oils, commercial entrees, frozen meals, and baked goods. Specific nutrient data for commercial food products made it possible to report brand names for many commercial food products reported in NHANES III.

The linkages to the USDA and NCC database systems required extensive work on the part of NCC and USDA staff. During the NHANES III data preparation process, two versions of the NHANES III data files were produced. NCC developed the NHANES III code generator program. The code generator program processes the survey interview data and assigns food codes (USDA and NCC) and gram weights to foods reported in the survey. The survey interview data files were processed using the USDA and NCC versions of the code generator program. For example, the NCC version produced NCC food codes and food gram weights; the NCC food codes linked to the NCC food composition database (29). Similarly, the USDA versions of the database files were produced using the USDA version of the code generator program; the output from the code generator was merged with the USDA nutrient composition databases used in NHANES III (28).

One feature of the NCC version of the NHANES III code generator output is that NHANES III data can be processed using updated versions of the NCC database. Updated versions of the NCC nutrient composition database were provided by NCC after the NHANES III public release data files were released in 1997 and 1998 (26,27). NCHS used NCC database version 28 to produce intake estimates for vitamin K and 3-methylhistidine; NCC database version 30 was used to produce revised intake estimates for vitamin A, retinol,

and carotenes expressed as beta carotene equivalents, as well as new information on trans fatty acids and individual carotenoids.

Data Editing

NCHS staff reviewed and edited the dietary interview data files. Editing guidelines were developed by NCHS staff in consultation with USDA and NCC staff and other knowledgeable sources, and NCHS staff prepared guidelines to document data editing decisions (30). Dietary interviewers coded the quality of all 24-hour recall interviews as "reliable," "unreliable," "refusal," or "not interviewed" (20). If the respondent made a reasonable effort to complete the 24-hour recall, it was considered to be reliable. On the other hand, if the respondent was confused or had extraordinary difficulty recalling foods and beverages consumed the day before, the recall was coded "unreliable." A "reliable" recall may result in unusually high or low intakes for various nutrients. For example, a 12–15-year-old non-Hispanic white male consumed a large quantity of a highly fortified cereal resulting in an extremely high intake value for vitamin E and some other nutrients. Data for this person are included in the reference tables shown in this report because the recall data were determined to be correct and "reliable." There may be situations where it would be appropriate to exclude this or other outliers because of the effect it would have on the overall analysis and conclusions, especially when sample sizes are small.

Quality Control and Analytic Issues

A number of quality-control monitoring techniques were employed during the survey. The techniques for monitoring the dietary interview component included observations of actual dietary interviews and reviews of audiotaped interviews by NCHS and contractor staff. In addition, the dietary interviewers worked in two-person teams; there was one team in each MEC. The dietary interviewers

performed 10-percent cross-check reviews of their partners' work using printed recall reports. Finally, newsletters, field memoranda, telephone calls, and staff retraining sessions were other methods used to maintain quality control during the survey. Refer to the NHANES III Dietary Interviewer's Training Manual for the dietary interview protocol (20).

The nutrient data reported in this report are based on data collected on over 445,000 foods reported by NHANES participants between 1988 and 1994. Shortly after the tables for this report were produced, NCHS was informed of a problem with 50 of the NHANES III food records. The problem resulted from a data base error for a particular type of danish pastry. Incorrect nutrient values for the pastry were generated for the NCC version of the nutrient intakes file; the USDA database nutrient values were not affected. NCC nutrients for the 50 food records were recalculated. It was not feasible to run the nutrient and food constituent tables again for this report.

NCHS evaluated the impact of the erroneous records by comparing the mean intakes with and without the incorrect pastry data. The results showed that the nutrient intakes of males in the 40–49 year age group were most affected. However, the impact of the erroneous records on mean intakes of energy, fat, folate, and iron were not statistically significant. Furthermore, the comparative analysis did not alter the interpretation of the data in this report. NCHS will provide NHANES data users with a correction file for future NHANES III analyses via the NCHS/NHANES Web site.

Demographic Terms

In this report, age is defined as age in years at the time of the household interview. Age in years was defined as the integer referring to age at last birthday. For example, all children 10.00–10.99 would be defined as 10 years old. Information on self-reported race and ethnicity was used to classify persons as non-Hispanic white, non-Hispanic black, Mexican American, or other race-ethnic group. Separate estimates are presented for non-Hispanic

white, non-Hispanic black, and Mexican American only categories. Participants of other race-ethnic groups are included in the total or "all race-ethnic groups" category because there were not enough of them to allow reliable estimates. The categories of age and race-ethnicity used for the tables in this report are based on the sample design subdomains and are those recommended for improved precision of estimates in the *NHANES III Analytic Guidelines* in the section titled "Key Variables for Analysis" (19). Poverty status was defined using the poverty income ratio (PIR) and categorized as below poverty level (PIR less than 1.30) and at or above poverty level (PIR of 1.30 or more). Poverty income ratio is a calculated variable based on income and family size using tables published each year by the U.S. Bureau of the Census (31). This variable has been adjusted to account for inflation and other factors. However, the manner in which it is calculated has changed slightly over time. The cutoff point selected is consistent with that used to determine eligibility for the Food Stamp Program.

Statistical Methodology

Population means, medians, and standard errors of the mean (SEM's) for nutrient intakes based on 1-day 24-hour dietary recall data are presented in this report. Standard errors of the mean were computed using SUDAAN, a program that takes into account the sampling weights and complex sample design for calculating variance estimates (32). Sample weights are used to produce accurate population estimates because each sample person does not have the same probability of selection. The sample weights incorporate the differential probabilities of selection and include adjustments for oversampling of certain populations, noncoverage, and nonresponse. Sample weights for the six-year sample are used to produce estimates for all nutrients in the file.

Some nutrient estimates are, by their nature, very skewed (for example, alcohol, copper, iron, zinc, vitamin A, carotenes, vitamin B₁₂, and vitamin E). This is because food and nutrient intakes varies from day to day.

Consumption of certain nutrients may be very high or very low for some individuals on a specific day, which influences population distributions. For non-normally distributed variables, the means and standard errors of the means for such variables, which assume normality, should be used and interpreted with caution.

Reliability of an estimated mean or median also depends on the coefficient of variation or relative standard error (RSE), defined as the ratio of the standard error of the estimate to the estimate times 100. The larger the RSE of the estimate, the less reliable the estimate. In this report, estimates with an RSE greater than 25 percent are deemed unreliable. An asterisk on certain estimates denotes data that are not presented because criteria for reliability or precision for reporting were not met. The use of these criteria follow recommendations described in the *NHANES III Analytic Guidelines* in the appendix titled “The Joint Policy on Variance Estimation and Statistical Reporting Standards on NHANES III and CSFII Reports: HNIS/NCHS Analytic Working Group Recommendations” (19).

Results

The data tables provided in this report were produced using food composition data from the USDA and NCC databases. All of the nutrients reported in the USDA database were included in the NCC database. In general, the nutrient intake estimates derived from USDA and NCC databases were similar. An explanation for this observation is provided. First, a high percent of the NCC nutrient composition data are based on USDA food composition data. For example the nutrient composition data for many basic (termed “elemental”) foods such as flour, sugar, eggs, fresh fruits and vegetables, and milk are similar in the USDA and NCC databases. Second, there is comparability in the USDA and NCC versions of the databases used to process NHANES III data. NCC database nutritionists assigned USDA

food codes to the foods found in the NCC database using the same database decision-making process used to develop the NCC database using NCC food codes. When the NCC database was linked to the USDA database, essentially a “USDA version” of the NCC database was produced; NCC database coding methods were adapted so that USDA food codes could be assigned to foods and recipe ingredients. The end result is that food formulation nutrient profiles were similar, regardless of the database version. There are a few exceptions to this rule and these reflect true differences in the database management processes used by NCC and USDA. However, the impact of these differences was small in terms of their impact on the NHANES III data reports. A more detailed description of the database linkage is provided in the NHANES III foods files CD-ROM documentation (27).

Tables 1–66 include national reference estimates of intakes of energy, macronutrients, vitamins, minerals, and other substances reported for persons 2 months of age and older using the USDA Survey Nutrient Database (SNDB). Tables 67–148 include those nutrients and other substances for which data from the University of Minnesota’s Nutrition Coordinating Center (NCC) were used.

In preparing this report, when estimates could be produced with USDA data, only estimates based on USDA data are reported. When only the NCC database provided information, estimates based on NCC data were included in this report. One exception is dietary fat data. There are small differences amounting to one or two grams (or less) in the mean fat intake estimates derived from the USDA and NCC databases. Intake estimates derived using the USDA database are typically lower than the estimates produced using the NCC database. The differences in the estimates reflect differences in the fat composition data for dietary fat sources, recipe differences, and coding decisions that were made to link and/or map foods to the databases. Selected dietary intake findings NHANES III, 1988–94 values for means, standard errors of the means (SEM), and medians are reported by age

and gender for the total population and for three race/ethnicity groups: non-Hispanic white, non-Hispanic black, and Mexican American. They are also reported by income (using Food Stamp Program income cutoff points.)

Discussion

The NHANES III, 1988–94 data updates NHANES II health and nutrition data that were collected between 1976–80. In NHANES I and NHANES II, data were collected for individuals ages 6 months to 74 years. NHANES III included people ages 2 months and older (i.e., with no upper age limit). For the first time, NHANES data are available for young infants and the very elderly. The data reported here reflect changes in food consumption patterns that have occurred since NHANES I and NHANES II as well as changes in dietary survey methodology, survey food coding, and nutrient composition database changes. All of these complex factors should be considered when comparing data between two surveys. A brief summary of the methodological and database issues follows.

NHANES I and NHANES II 24-hour recalls were collected on paper copy forms and manually coded by the dietary interviewers whereas NHANES III utilized an automated interview and coding system. The automated system provided a standardized interview format and automated food probes. Food coding was automated. This made the interviewer’s work less tedious and provided an expanded capability to record more detailed information about foods consumed. The NHANES III foods database was much larger and more diverse than the databases used in previous NHANES. The DDC System database included over 8,000 foods and 3,000 commercial products. Detailed probes for recipe ingredients, preparation ingredients such as fat and salt, and ethnic foods provided a more comprehensive and complete list of foods consumed by respondents. Rigorous database quality-control procedures were maintained by USDA

and NCC throughout the survey.

Nutrient data for foods were evaluated systematically; new recipes were developed and added to the databases, including recipes for many Mexican American foods; and new food weight and volume data were incorporated into the USDA and NCC databases.

Additionally, significant improvements were made to the commercial foods data to reflect the changing market. Hundreds of foods having reduced fat, sodium, and sugar content were added to the USDA and NCC databases used for NHANES III analysis (28,29).

Significant nutrient composition database changes occurred after NHANES II was completed. For example, in 1989, the cholesterol content of whole eggs was reduced by 22 percent due to updated nutrient composition data (33). Other changes in the database due to changes in the types of fats and oils used to formulate many foods, particularly commercial baked goods, resulted in lower saturated fat and cholesterol content for commonly consumed foods. The survey recipe files were changed following a recommendation by the salt industry to change the weight of table salt, a common recipe ingredient, from 5.5 grams to 6 grams per teaspoon. The nutrient composition databases used to process the NHANES III data reflect changes in the marketplace and in the nutrient composition databases.

After NHANES II, considerable research was completed to describe, document, and quantify food consumption underreporting in dietary surveys. Studies documented that food consumption is underreported by as much as 25 percent and occurs more often in women, overweight persons, and weight-conscious persons (34,35). The NHANES III automated interview system and the dietary interview protocol were designed to improve the completeness and accuracy of the dietary interview data. Dietary interviewer training was redesigned and expanded to provide the interviewers with the skills and knowledge to conduct bilingual interviews, probe for recipe ingredients, and assist

respondents with dietary recall and portion size estimation tasks. The multiple pass approach used in NHANES III and the use of systematic probes for foods, including foods added at the table, were designed specifically to capture complete recall data. As a final check for completeness, the respondents were asked to review a list of frequently forgotten foods. Underreporting in NHANES III was addressed as a research topic (36). Ratios of energy intake (EI) to basal metabolic rate (BMR) were calculated for adults based on previously published formulas (35). The findings suggest a more complete reporting of intake in NHANES III compared with NHANES II. Underreporting in some groups, however, particularly females and overweight adults, must be considered in interpreting dietary survey data.

Interpretation of the NHANES III nutrient intake data requires some qualifications. Because data are not age adjusted, race-ethnic comparisons used only age-specific estimates. Some nutrient estimates are, by their nature, very skewed (for example, copper, iron, zinc, vitamin A, carotenes, vitamin B₁₂, and vitamin E). This is because food and nutrient intake varies from day to day. Consumption of certain nutrients may be very high or very low for some individuals on a specific day, which influences population distributions. For non-normally distributed variables, the means and standard errors of the means, which assume normality, should be used and interpreted with caution.

These data constitute one of the most comprehensive compilations of nutrient intake data on the U.S. population and major population subgroups. Intervention strategies aimed at reducing the prevalence of nutrition-related diseases, including designing nutrition policies and nutrition education and assistance programs, require effective monitoring of what Americans are eating. Nutrient reference data from the third National Health and Nutrition Examination Survey provide essential information to achieve these goals.

— Quantity zero.

¹Includes data for unknown poverty income ratio, which is not shown separately.

²Excludes nursing infants and children.

NOTE: Distribution of this nutrient is very skewed; means and standard errors of the means should be used and interpreted with caution.

¹Includes data for poverty income ratio, which is not shown separately.²Excludes nursing infants and children.

Appendix

Dietary Terms and Calculation Procedures

USDA Database

Energy and nutrient intakes for individuals were calculated using the gram amounts of food consumed and the USDA Survey Nutrient Database (SNDB) nutrient values for the food expressed per 100 grams of food (28). The percent contributions of protein, fat (including fatty acid components), carbohydrate, alcohol, fiber, and numerous micronutrients were calculated.

Macronutrients—carbohydrates, fat, protein, and alcohol. They are the principal dietary sources of energy.

Total energy intake—measured in kilocalories (kcal) and was calculated from grams of daily intake of protein, carbohydrate, fat, and alcohol. The energy conversion factors used were 4 kcal per gram for protein and carbohydrate, 9 kcal per gram for total fat and fatty acids, and 7 kcal per gram for alcohol (37).

Percents of energy intake—the total kcal from each energy source that was divided by the individual's total energy intake and multiplied by 100 to give the percent contributions. Figures may not add to 100 due to rounding.

Total carbohydrate—sugars and complex carbohydrates. Sugars include monosaccharides such as glucose and fructose and disaccharides such as sucrose, maltose, and lactose. Complex carbohydrates (polysaccharides) comprise starches and dietary fibers.

Total fat—saturated, polyunsaturated, and monounsaturated fatty acids, nonfatty acid components of fat such as glycerol, phosphoric acid aminobases of phospholipids, sterols (including cholesterol), and fat-soluble vitamins.

Carotenes—vitamin A activity derived from beta-carotene and other provitamin A carotenoids expressed as micrograms of retinol equivalents.

Dietary fiber—total dietary fiber, including both the insoluble fraction

(cellulose, hemicellulose, and lignin) and the soluble fraction (for example, gums in cereal grains and pectin in fruits and vegetables).

Folate—total folate activity.

Niacin—nicotinic acid and nicotinamide present in foods. Does not include potential niacin that could be converted from dietary tryptophan, a niacin precursor, in the body.

Sodium—naturally occurring sodium, sodium contributed by compounds used in food processing, and a calculated amount of sodium used for food preparation. Excludes sodium from salt added at the table.

Vitamin E—vitamin E activity derived from alpha-, beta-, and gamma-tocopherol and alpha-tocopherol expressed as milligrams alpha-tocopherol equivalents (alpha-TE). One alpha-tocopherol equivalent equals 1 milligram of alpha-tocopherol, 2 milligrams of beta-tocopherol, 10 milligrams of gamma-tocopherol, or 3.3 milligrams of alpha-tocotrienol.

NCC Database

Energy, nutrient, and food component intakes for individuals were calculated using the gram amounts of food consumed and the Nutrition Coordinating Center (NCC) Nutrient Composition Database, versions 15–30. Nutrient values for foods are compiled and reported by this database on a per gram basis. The NCC nutrient and food component variable descriptions listed below were based on their documentation (29).

Percent contributions of protein, fat (including fatty acid components), carbohydrate, alcohol, fiber, and numerous micronutrients were calculated.

Calories—a measure of food energy and are expressed in kilocalories. Published values are obtained from chemical analyses or calculated using specific fuel factors based on Atwater coefficients for each food group. Values approximate the following:

$$(4 \text{ X gm protein}) + (9 \text{ X gm fat}) + \\ (4 \text{ X gm available carbohydrate}) + \\ (7 \text{ X gm alcohol})$$

Proximate Nutrients

Total fat—a mixture of triglycerides, phospholipids, sterols, and similar compounds. Values are determined by chemical analyses and are expressed in grams.

Total carbohydrate values—calculated per 100 gm as the difference between 100 and the sum of the percents of water, protein, fat, ash, and alcohol. Total carbohydrate is approximately equal to the sum of available carbohydrates (starch and sugars) and dietary fiber. Values are expressed in grams.

Total protein values—calculated from total nitrogen content adjusted for nonprotein nitrogen and using conversion factors specific for each food group. Values are expressed in grams.

Alcohol volume—converted to weight by use of conversion factors based on the specific gravity of alcohol. Amounts are expressed in grams.

Ash—a measure of the residue remaining after oxidation of a food in a bomb calorimeter. It contains some, but not all, of the minerals in the food. Values are expressed in grams.

Water values—obtained from chemical analyses and are expressed in grams.

Animal protein—protein from animal products and includes meats, eggs, and dairy foods. Values are given in grams.

Vegetable protein—the amount of protein contributed by plant products and is expressed in grams. The sum of animal and vegetable protein in a food equals the total protein of that food.

Amino acids—organic acids that are the basic components of protein. They are determined by chromatographic or microbiological methods. Values include both protein-bound and free forms and are expressed in grams. Eighteen amino acids are presented; the field for cystine includes cysteine as well.

3-Methylhistidine (3-MH)—an amino acid found in both protein-bound and soluble forms in animal tissue. The NCC database contains values for only protein-bound 3-MH, which is given in milligrams. Protein-bound 3-MH is

found at very consistent levels in the skeletal muscles of a wide variety of species and is only found in muscular protein tissue.

Fatty acids—grouped as saturated (no double bonds), monounsaturated (one double bond), and polyunsaturated (two or more double bonds). Values do not include the glycerol portion of the triglyceride or other fat-related compounds. Therefore, the sum of fatty acids is less than the total fat in the food. Fatty acids are expressed by number rather than by scientific name (e.g., 18:1). The first number refers to the number of carbon atoms in the fatty acid chain, and the second number refers to the number of double bonds between carbon atoms. Fatty acid values include all positional and geometric isomers of the fatty acid. Values in the database are in grams.

Trans fatty acids—geometrical isomers of unsaturated fatty acids in which double bonds are converted from *cis* isomers where hydrogen atoms are aligned on the same side of the carbon chain to *trans* isomers where the hydrogen atoms are oriented on opposite sides. This transformation occurs most frequently during hydrogenation of vegetable oils to create solid or semisolid fats. The database includes 16:1 trans, 18:1 trans, 18:2 trans (trans-cis, cis-trans, and trans-trans) and total trans fatty acids. Values are in grams.

Sucrose—a disaccharide composed of glucose and fructose moieties. Sucrose values include sucrose used as an ingredient in manufactured foods and recipes as well as naturally occurring sugars. Due to inversion, which may occur during storage, sucrose values were selected for foods stored under normal conditions and time periods. Values are expressed in grams.

Starch—dextrans and glycogen. Values are in grams.

Total dietary fiber—unavailable carbohydrates (cellulose, hemi cellulose, pectins, gums, and muscillages) and lignin. Values are obtained by chemical analyses or from the sum of insoluble dietary fiber and soluble dietary fiber. Values are expressed in grams.

Insoluble dietary fiber—the portion of dietary fiber determined by the modified Van Soest neutral detergent method. This includes cellulose, some hemicellulose, and lignin. Values are in grams.

Soluble dietary fiber values—determined by chemical analyses or calculated from the difference between total dietary fiber and insoluble dietary fiber. It includes pectins, gums, muscillages, and some hemicellulose. Values are in grams.

Pectins—included in soluble dietary fiber. Values are obtained from chemical analyses and are given in grams.

Mineral Values

Mineral values represent the total amount in a food, although not all may be available to the body. The values generally do not include minerals present in tap water used to prepare a product.

Iron—both heme and nonheme iron expressed in milligrams.

Selenium values—given in micrograms. Values were selected that are representative of foods grown in locations where neither excesses nor deficiencies of selenium are evident.

Sodium—naturally occurring sodium in foods as well as that added during food processing. It does not include sodium from salt added at the table. Sodium values are in milligrams.

Vitamins

Vitamin A—preformed vitamin A (retinol) and provitamin A carotenoids expressed as beta-carotene activity. Values are analyzed or calculated from the following:

$$\text{I.U. vitamin A} = (\text{mcg retinol}/0.3) + (\text{mcg beta-carotene equivalents}/0.6)$$

$$\text{RE vitamin A} = \text{mcg retinol} + (\text{mcg beta-carotene equivalents}/6)$$

Retinol—preformed vitamin A found only in animal products. Values are given in micrograms. 1 mcg retinol provides 1 RE vitamin A or 3.33 I.U. vitamin A.

Beta carotene equivalents—vitamin A activity from the provitamin A carotenoids: beta-carotene, alpha-carotene, and beta-cryptoxanthin.

Beta-carotene equivalents are calculated from the following:

$$\begin{aligned} \text{mcg beta-carotene equivalents} &= \\ \text{mcg beta-carotene} &+ 1/2(\text{mcg alpha} \\ \text{carotene} &+ \text{mcg beta-cryptoxanthin}) \end{aligned}$$

Values are expressed in micrograms. 6 mcg beta-carotene equivalents provide 1 RE vitamin A or 10 I.U. vitamin A.

Carotenoids—alpha-carotene, beta-carotene, beta-cryptoxanthin, lutein+zeaxanthin, and lycopene. Primary food sources are fruits and vegetables. Only plants have the ability to synthesize carotenoids, but animals can utilize them from their feed and store them in their tissues. Carotenoids also may be added to foods for coloration purposes. Alpha-carotene, beta-carotene, and beta-cryptoxanthin are vitamin A precursors, with beta-carotene yielding twice the vitamin A activity of the other two provitamin A carotenoids. Carotenoid values are given in micrograms.

Total alpha-tocopherol equivalents (or vitamin E)—activity from alpha-, beta-, gamma-, and delta-tocopherol. Values are expressed in milligrams of alpha-tocopherol equivalents.

$$\begin{aligned} \text{mg alpha-toc equivalents} &= \text{mg} \\ \text{alpha-toc} &+ (0.4 \times \text{mg beta-toc}) + \\ (0.1 \times \text{mg gamma-toc}) &+ (0.01 \times \\ \text{mg delta-toc}) \end{aligned}$$

$$1 \text{ mg alpha-toc equivalents} = 1.49 \text{ I.U. vitamin E.}$$

Vitamin K values—vitamin K₁ (phylloquinone), which is found in natural food sources, but do not include vitamin K₂ (menaquinone), the form synthesized by bacteria in the human intestines. Generally, values are those derived by high-performance liquid chromatography and are reported in micrograms.

Vitamin D—calciferol (vitamin D₂) and cholecalciferol (vitamin D₃). Values are expressed in micrograms. 0.025 mcg vitamin D = 1 LU.

Vitamin C—total vitamin C expressed as the activity of reduced ascorbic acid. Values are in milligrams.

Thiamin (also known as vitamin B₁)—both bound and free forms and is expressed in milligrams.

Riboflavin (also known as vitamin B_2)—both bound and free forms. Values are in milligrams.

Niacin—bound and free forms. Values do not include amounts that could be contributed by the precursor, tryptophan. Amounts are given in milligrams.

Pantothenic acid values—both free and bound forms, which have been determined by microbial assay or Rhodymeniaceae. They are expressed in milligrams.

Vitamin B₆—three forms, pyridoxine, pyridoxal, and pyridoxamine. Values are determined using a microbiological method or by liquid chromatography and are expressed in milligrams.

Folate—a group of biologically active compounds, pteroylmono glutamic acid (PGA) and its derivatives. Values include all forms of PGA, both bound and free. Values selected are those measured with *L. casei* using

conjugate treatment for release of bound forms and ascorbic acid for protection from oxidation. Amounts are given in micrograms and were updated in 4.02–30 to reflect Federal fortification regulations.

Vitamin B₁₂—occurs in several forms designated as cobalamin. Values are generally those obtained by assay with *L. leishmanni*. Vitamin B₁₂ is found only in animal products. Values are expressed in micrograms.

Other Food Components

Cholesterol—a sterol associated with animal fats. It is generally not found in plant products. Values are expressed in milligrams.

Aspartame—a nutritive synthetic sweetener consisting of the amino acids phenylalanine and aspartic acid and a small amount of methanol. It is marketed as NutraSweet. Values are presented in milligrams.

Saccharin—a non-nutritive artificial sweetener. Saccharin values are expressed in milligrams.

Caffeine—given in milligrams. Values do not include theobromine. The caffeine value for brewed coffee represents weighted averages of automatic drip and percolated values provided by the USDA database.

Phytic acid—a naturally occurring plant constituent that functions as the storage form of phosphorous for the germinating seed. It is an inositol phosphate consisting of a ring of six phosphate ester groups. It is expressed in milligrams in the database.

Oxalic acid—a dicarboxylic acid found in most plant tissues; very little occurs in animal products. It may be present as sodium or potassium salts (soluble oxalate) or as calcium oxalate or other bound forms (insoluble oxalate). Values in the database are in milligrams.

Vital and Health Statistics series descriptions

- SERIES 1. **Programs and Collection Procedures**—These reports describe the data collection programs of the National Center for Health Statistics. They include descriptions of the methods used to collect and process the data, definitions, and other material necessary for understanding the data.
- SERIES 2. **Data Evaluation and Methods Research**—These reports are studies of new statistical methods and include analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory. These studies also include experimental tests of new survey methods and comparisons of U.S. methodology with those of other countries.
- SERIES 3. **Analytical and Epidemiological Studies**—These reports present analytical or interpretive studies based on vital and health statistics. These reports carry the analyses further than the expository types of reports in the other series.
- SERIES 4. **Documents and Committee Reports**—These are final reports of major committees concerned with vital and health statistics and documents such as recommended model vital registration laws and revised birth and death certificates.
- SERIES 5. **International Vital and Health Statistics Reports**—These reports are analytical or descriptive reports that compare U.S. vital and health statistics with those of other countries or present other international data of relevance to the health statistics system of the United States.
- SERIES 6. **Cognition and Survey Measurement**—These reports are from the National Laboratory for Collaborative Research in Cognition and Survey Measurement. They use methods of cognitive science to design, evaluate, and test survey instruments.
- SERIES 10. **Data From the National Health Interview Survey**—These reports contain statistics on illness; unintentional injuries; disability; use of hospital, medical, and other health services; and a wide range of special current health topics covering many aspects of health behaviors, health status, and health care utilization. They are based on data collected in a continuing national household interview survey.
- SERIES 11. **Data From the National Health Examination Survey, the National Health and Nutrition Examination Surveys, and the Hispanic Health and Nutrition Examination Survey**—Data from direct examination, testing, and measurement on representative samples of the civilian noninstitutionalized population provide the basis for (1) medically defined total prevalence of specific diseases or conditions in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics, and (2) analyses of trends and relationships among various measurements and between survey periods.
- SERIES 12. **Data From the Institutionalized Population Surveys**—Discontinued in 1975. Reports from these surveys are included in Series 13.
- SERIES 13. **Data From the National Health Care Survey**—These reports contain statistics on health resources and the public's use of health care resources including ambulatory, hospital, and long-term care services based on data collected directly from health care providers and provider records.
- SERIES 14. **Data on Health Resources: Manpower and Facilities**—Discontinued in 1990. Reports on the numbers, geographic distribution, and characteristics of health resources are now included in Series 13.
- SERIES 15. **Data From Special Surveys**—These reports contain statistics on health and health-related topics collected in special surveys that are not part of the continuing data systems of the National Center for Health Statistics.
- SERIES 16. **Compilations of Advance Data From Vital and Health Statistics**—Advance Data Reports provide early release of information from the National Center for Health Statistics' health and demographic surveys. They are compiled in the order in which they are published. Some of these releases may be followed by detailed reports in Series 10–13.
- SERIES 20. **Data on Mortality**—These reports contain statistics on mortality that are not included in regular, annual, or monthly reports. Special analyses by cause of death, age, other demographic variables, and geographic and trend analyses are included.
- SERIES 21. **Data on Natality, Marriage, and Divorce**—These reports contain statistics on natality, marriage, and divorce that are not included in regular, annual, or monthly reports. Special analyses by health and demographic variables and geographic and trend analyses are included.
- SERIES 22. **Data From the National Mortality and Natality Surveys**—Discontinued in 1975. Reports from these sample surveys, based on vital records, are now published in Series 20 or 21.
- SERIES 23. **Data From the National Survey of Family Growth**—These reports contain statistics on factors that affect birth rates, including contraception, infertility, cohabitation, marriage, divorce, and remarriage; adoption; use of medical care for family planning and infertility; and related maternal and infant health topics. These statistics are based on national surveys of women of childbearing age.
- SERIES 24. **Compilations of Data on Natality, Mortality, Marriage, Divorce, and Induced Terminations of Pregnancy**—These include advance reports of births, deaths, marriages, and divorces based on final data from the National Vital Statistics System that were published as supplements to the *National Vital Statistics Report* (NVSR). These reports provide highlights and summaries of detailed data subsequently published in *Vital Statistics of the United States*. Other supplements to the NVSR published here provide selected findings based on final data from the National Vital Statistics System and may be followed by detailed reports in Series 20 or 21.
