1.0 RELEVANT BACKGROUND INFORMATION

Under Contract No. 211-2014-58081, SC&A was tasked by the Advisory Board on Radiation and Worker Health (Advisory Board) to perform six blind dose reconstructions (DRs) at the July 2014, DR Subcommittee meeting. SC&A was provided all of the Department of Energy (DOE) dosimetry records; the Department of Labor (DOL) correspondence, forms, and medical records; and the Computer-Assisted Telephone Interview (CATI) Reports that were made available to the National Institute for Occupational Safety and Health (NIOSH) for constructing doses in behalf of these cases. SC&A used an independent approach to reconstruct occupational external and internal doses for the cases using the available dosimetry records and current guidance from NIOSH; including the spreadsheets and other tools developed by NIOSH to calculate the doses.

On February 12, 2015, SC&A submitted to the Advisory Board and NIOSH, a memorandum containing the summary results of our blind DR in behalf of Case # [Redact]. After reviewing our draft DR blind report, it was determined that there was a slight error in calculating external doses for two of the eight cancers. Therefore, SC&A resubmitted the corrected total doses and resultant Probability of Causation (POC) for this case in a memo dated March 16, 2015. The complete DR report titled *SC&A's Dose Reconstruction of Case # [Redact] from the Nevada Test Site* (SCA-TR-BDR2015-CN[Redact]), which provides the assumptions and methodologies used to derive occupational radiation doses and resultant POC, is included herein as Addendum A.

In this report, SC&A presents a comparison between NIOSH's and SC&A's DR methodologies, doses, and resultant POC values for Case # [Redact]. Table 1-1 summarizes the external and internal occupational doses calculated by SC&A and the NIOSH-assigned doses for the eight cancers diagnosed in behalf of Case # [Redact]. A detailed comparison of the two methodologies used to calculate doses in behalf of this case is presented in Section 2. Section 3 of this report provides Summary Conclusions.

It should be noted that, where appropriate, an explanation is provided regarding the differences in doses and why they occurred; however, SC&A does not make any value judgments regarding which among them may be the more preferred approach. It is our position that further discussions are best addressed by the DR Subcommittee.

2.0 COMPARISON OF METHODOLOGY/DOSES USED BY SC&A AND NIOSH FOR CASE # [REDACT]

Case # [Redact] represents an energy employee (EE) who worked as a [redact] at the Nevada Test Site (NTS) during the following periods:

- [redact]–[redact]
- [redact]–[redact]
- [redact]–[redact]
- [redact]–[redact]

The EE was diagnosed with eight cancers during the period [redact]–[redact], as summarized in Table 2-1:

Table 2-1. Summary of Cancers

Cancer	Cancer Site	ICD-9 Code	Year
#1	Malignant melanoma [redact]	172.5	[redact]
#2	BCC [redact] scalp	173.41	[redact]
#3	Prostate	185	[redact]
#4	BCC [redact] neck	173.41	[redact]
#5	Melanoma [redact] neck	172.4	[redact]
#6	SCC in-situ [redact]	232.32	[redact]
#7	Essential thrombocythosis	238.71	[redact]
#8	SCC in-situ [redact]	232.3	[redact]

BCC = Basil cell carcinoma, SCC = Squamous cell carcinoma

This was a partial DR, because not all internal doses could be assigned prior to 1993, as per the NTS Special Exposure Cohort (SEC), which is discussed in ORAUT-TKBS-0008-5, page 12:

NIOSH has determined, and the Secretary of Health and Human Services has concurred, that in the absence of bioassay results for the worker, internal doses cannot be reconstructed between 1951 and 1962 inclusive for an Energy Employee (EE). Based on the SEC petition evaluation, internal dose is not to be reconstructed for work before 1963 unless a worker has specific bioassay results that can be directly related to an event or incident.

NIOSH has determined, and the Secretary of Health and Human Services has concurred that NIOSH lacks sufficient information that would allow it to adequately estimate internal exposures during the period 1963 through 1992.

The EE was employed at NTS during the SEC period; however, since at least one of the cancers was a non-presumptive cancer, a DR was required.

For calculating radiation dose from employment at NTS, both DR methods primarily relied on guidance in the NTS Technical Basis Document (TBD) (issued as six separate documents numbered ORAUT-TKBS-0008-1 through ORAUT-TKBS-0008-6). Using the guidance

Effective Date: April 13, 2015	Revision No. 0 (Draft)	Document No. SCA-TR-DRC2015-CN [Redact]	Page No. 9 of 21
--	----------------------------------	---	----------------------------

provided in these documents, along with the employee's dosimetry records, SC&A employed a best-estimate approach for calculating annual external and internal doses. NIOSH employed a combination of best-estimate and over-estimate approaches for calculating annual external doses and a best-estimate approach for internal doses. Both SC&A and NIOSH derived a probability of causation (POC) of <50%.

A summary of the documents, assumptions, and dose parameters used by each DR method is provided in Tables 2-2 and 2-3 below:

2.1 OCCUPATIONAL EXTERNAL DOSE CALCULATIONS

2.1.1 Recorded Photon and Electron Doses

The DOE files contained monthly badge readings. Most of the recorded readings were zero with the only positive reading recorded in [redact]. All recorded shallow doses were zero or <LOD/2.

Comparison of SC&A's and NIOSH's Methods and Doses for Recorded Photons

Both DR methods assumed the EE worked primarily in the NTS [redact]. Therefore, the photon energy fraction of 22% 30–250 keV and 78% >250 keV was assumed, as specified in ORAUT-TKBS-0008-6, Table 6-13, page 50, for areas associated with routine [redact] operations. Both SC&A and NIOSH selected DCFs that reflected Exposure (R) to Organ Dose (H_T) values from OCAS-IG-001. The urinary bladder was used as the surrogate organ for the prostate (ORAUT-OTIB-0005, page 20), and the red bone marrow (RBM) was used as the surrogate organ for the thrombocytosis (ORAUT-OTIB-0005, page 38). SC&A and NIOSH used the mode DCF values listed in OCAS-IG-001; it did not appear that NIOSH used Monte Carlo-generated DCFs in this case.

Using the EE's dosimetry records and above-cited parameters, SC&A and NIOSH assigned photon and electron recorded doses, as shown in Table 2-4. The slightly larger photon doses assigned to the prostate and RBM by NIOSH reflects NIOSH's use of a conservative DCF of 1.00 when OCAS-IG-001 recommended a DCF of <1.00. In addition, NIOSH used a constant distribution for the prostate and RBM doses; therefore, the derived dose was multiplied by an uncertainty factor of 1.3 before it was entered into the IREP Input tables. SC&A used the DCFs as recommended in OCAS-IG-001, and a normal distribution, with the 30% uncertainty entered into Parameter 2 of the IREP Input tables.

Effective Date: April 13, 2015	Revision No. 0 (Draft)	Document No. SCA-TR-DRC2015-CN [Redact]	Page No. 12 of 21
--	----------------------------------	---	-----------------------------

Table 2-4. Comparison of Recorded Photon Doses

	SC&A (rem)	NIOSH (rem)
Prostate total recorded photon dose	0.048	0.069
RBM total recorded photon dose	0.035	0.065
Skin total recorded photon dose – 1979*	0.050	0.050

*There was only recorded dose during 1979.

2.1.2 Missed Photon and Electron Doses

Missed photon and electron doses were assigned by both SC&A and NIOSH.

Comparison of SC&A's and NIOSH's Methods Used to Assign Missed Dose

SC&A analyzed the number of actual zeros and potential zeros based on a monthly badge exchange cycle using the guidance in OCAS-IG-001, page 16, to arrive at a total of **207 zeros** (or <LOD/2 values) for photons, and **1 zero** (or <LOD/2 value) for electrons; this matched the number of zeros used by NIOSH in this case. SC&A and NIOSH used the annual number of zeros, the LOD/2 value, the DR parameters as listed above, and the applicable DCFs to determine the annual missed photon and electron doses.

SC&A's Missed Photon Dose

SC&A used the following methods to derive missed photon dose:

- DCFs as recommended in OCAS-IG-001 and ORAUT-OTIB-0017.
- For the skin cancer diagnosed in [redact], SC&A used 6 zeros to derive the missed photon dose because the cancer was diagnosed on [redact].
- For [redact], SC&A applied the dosimetry limit of detection (LOD) value of 0.040 rem for the months of January and February [redact], and the value of 0.030 rem for the months of March through December [redact].

NIOSH's Missed Photon Dose

NIOSH used the following methods to derive missed photon dose:

- DCFs as recommended in OCAS-IG-001, or a value of 1.00, whichever was greater.
- For the skin cancer diagnosed in [redact], NIOSH used the entire year of 12 zeros to derive the missed photon dose for the cancer that was diagnosed on [redact].
- For [redact], NIOSH applied the dosimetry LOD value of 0.040 rem for 12 months to some organs, and the value of 0.030 rem for 12 months to other organs.

Comparison of SC&A's and NIOSH's Missed Photon Doses

SC&A and NIOSH assigned missed photon and electron doses as shown in Table 2-5. The larger missed photon doses assigned by NIOSH were due to the fact that:

- NIOSH always applied DCF ≥ 1.00 for all organs for all photon energies, whereas SC&A used the DCFs recommended in OCAS-IG-001.

NOTICE: This report has been reviewed for Privacy Act information and has been cleared for distribution. However, this report is pre-decisional and has not been reviewed by the Advisory Board on Radiation and Worker Health for factual accuracy or applicability within the requirements of 42 CFR 82.

Effective Date:	Revision No.	Document No.	Page No.
April 13, 2015	0 (Draft)	SCA-TR-DRC2015-CN[Redact]	13 of 21

- NIOSH applied 12 zeros to the [redact] skin cancer that was diagnosed on [redact], which was greater than the dose derived by SC&A using 6 zeros.
- NIOSH applied the larger dosimeter LOD value of 0.040 rem for the entire year of [redact] to missed skin doses, whereas SC&A applied the larger dosimeter LOD value for only the months of January and February of [redact], and the lower value thereafter, as recommended in ORAUT-TKBS-0008-6, Table 6-1, page 19.
- NIOSH applied the smaller dosimeter LOD value of 0.030 rem for the entire year of [redact] to prostate and RBM missed doses, whereas SC&A applied the larger dosimeter LOD value for the months of January and February of [redact], and the lower value thereafter, as recommended in ORAUT-TKBS-0008-6, Table 6-1, page 17.

Table 2-5. Comparison of Missed Photon and Electron Doses

	SC&A (rem)	NIOSH (rem)
Prostate total missed photon dose	3.417	3.730
RBM total missed photon dose	2.483	3.540
Skin ([redact]) total missed photon dose	2.140	2.280
Skin ([redact]-[redact]) total missed photon dose	3.550	3.600
Skin total missed electron dose ([redact]-[redact])	0.015	0.015

Both DR methods entered missed photon and electron doses into the Interactive Radio-Epidemiological Program (IREP) as a lognormal distribution with an uncertainty of 1.520.

2.1.3 Onsite Ambient Doses

As per ORAUT-PROC-0060, page 14, external ambient dose should not be applied when the EE is assigned recorded and missed doses. Therefore, neither SC&A nor NIOSH assigned external ambient dose in this case, since the EE was assigned recorded and missed doses for all years of employment.

2.1.4 Occupational Medical Doses

Both DR methods:

- Calculated an occupational medical dose from diagnostic x-ray procedures required as a condition of employment.
- Used the number and type of x-ray exams as provided in the EE's DOE files.
- Assigned doses for 3 posterior-anterior (PA) view and 2 lateral (LAT) view x-ray exams.
- Used doses recommended in Tables 3-3 and 3-5 of ORAUT-TKBS-0008-3 for PA and LAT views.
- Assigned LAT view doses for x-ray exams performed after 1972, as per Table 3-5 of ORAUT-TKBS-0008-3.

Effective Date: April 13, 2015	Revision No. 0 (Draft)	Document No. SCA-TR-DRC2015-CN[Redact]	Page No. 14 of 21
--	----------------------------------	--	-----------------------------

Comparison of SC&A's and NIOSH's Medical X-ray Assigned Doses

SC&A and NIOSH assigned identical x-ray doses. Both DR methods used the pre-calculated skin dose table (Table 3-5 in ORAUT-TKBS-0008-3) for determining the various skin doses. Using data from this table provides for greater consistency in DR results as compared to manually calculating skin doses using the entrance skin dose (ENSD) and applying various modification factors for a particular skin location outside the primary beam, as is required if using values listed in the tables in Attachment C of ORAUT-PROC-0061. There is, however, still some subjectivity in the location selected for a given cancer site when using Table 3-5 of ORAUT-TKBS-0008-3. For example, the [redact] or scalp is not listed in Table 3-5; therefore, either the left side of the face or the eye/brain could be used as a possible surrogate organ for the [redact], and the right/left temple or the back of the neck are possible surrogate organs for the scalp. This can lead to some differences in the assigned dose for various locations. However, the x-ray doses to locations outside the primary beam are relatively small and the selection of surrogate organs generally does not impact the assigned dose significantly.

Table 2-6 shows a comparison of the occupational medical doses calculated by the two DR methods.

Table 2-6. Comparison of Occupational Medical Doses

	SC&A (rem)	NIOSH (rem)
Skin-[redact][redact]	0.133	0.133
Skin-scalp [redact]	0.042	0.042
Prostate [redact]	0.003	0.003
Skin-neck (2) [redact]	0.069	0.069
Skin-[redact][redact]	0.031	0.032
RBM [redact]	0.021	0.021
Skin-[redact][redact]	0.032	0.032

Both methods entered annual doses into IREP as a normal distribution with an uncertainty of 30%.

2.2 OCCUPATIONAL INTERNAL DOSES

There were no recorded bioassay results for this EE in the DOE records. According to the information provided in the Site Profile for the NTS SEC (ORAUT-TKBS-0008-5, page 12), internal radiation doses at NTS cannot be reconstructed prior to 1993. Therefore, because no bioassay data are available for the EE, no techniques can be employed to derive an estimate of internal dose, except for internal dose from the intake of ambient air activity.

2.2.1 Internal Environmental Dose

Both SC&A and NIOSH used the NTS site default radionuclides and associated intakes by inhalation as a function of year (ORAUT-TKBS-0008-4, Table A-7, page 67) and the maximum intake values for ingestion (ORAUT-TKBS-0008-4, Table A-12, page 77) for the years of employment in the chronic annual dose workbook (CADW) to derive a best estimate of the annual doses to the eight cancers. As per ORAUT-OTIB-0005 guidelines, SC&A used *all male*

Effective Date: April 13, 2015	Revision No. 0 (Draft)	Document No. SCA-TR-DRC2015-CN [Redact]	Page No. 15 of 21
--	----------------------------------	---	-----------------------------

genitalia as the surrogate organ for the prostate (page 20); the bone and also lymphoma & multiple myeloma for the thrombocytosis (page 38); and the corresponding type of skin cancer (i.e., malignant melanoma, BCC, or SCC) for each skin cancer site in the CADW. This evaluation included chronic inhalation and ingestion of NTS environmental Am-241, Co-60, Cs-137, Eu-152, Eu-154, Eu-155, Pu-238, Pu-239, Pu-240, and Sr-90 for full years from 1963 to 1982 (1963 was the first year that environmental data were available).

Essential thrombocytosis (ICD-9 Code 238.71)

According to ORAUT-OTIB-0005, page 38, for the essential thrombocytosis cancer (ICD-9 Code 238.71), both the bone and the lymphoma & multiple myeloma IREP models should be run, and the one that produces the greater dose used in the DR. Both SC&A and NIOSH found that the bone IREP model provided for the greater dose and used its associated annual doses in the IREP Input table.

Type SS Plutonium

The EE's cancer sites involved systemic organs. ORAUT-OTIB-0049, Table 4-8, page 17, recommends when assigning plutonium doses using measured air concentrations to systemic organs that no Type SS adjustment be made, because more soluble Types M or S plutonium provide for greater doses to these organs.

Table 2-7 shows a comparison of the internal doses calculated by the two DR methods.

Table 2-7. Comparison of Internal Environmental Doses

	SC&A (rem)	NIOSH (rem)
Skin-[redact] [redact]	0.003	0.003
Skin-scalp [redact]	0.009	0.009
Prostate [redact]	0.013	0.013
Skin-neck (2) [redact]	0.009	0.009
Skin-[redact] [redact]	0.010	0.010
RBM [redact]	0.234	0.234
Skin-[redact] [redact]	0.011	0.011

Both methods entered annual doses into IREP as a constant with zero uncertainty.

3.0 SUMMARY CONCLUSIONS

Total external and internal doses and resultant POCs calculated by NIOSH and SC&A in behalf of Case # [Redact] are presented in Table 3-1 for comparison.

Table 3-1. Comparison of SC&A's and NIOSH's Total External and Internal Dose Estimates for the 8 Cancers

	SC&A (rem)	POC	NIOSH (rem)	POC
Skin-[redact][redact]	2.256	4.31%	2.396	4.31%
Skin-scalp [redact]	3.666	12.66%	3.716	10.88%
Prostate [redact]	3.480	3.45%	3.814	3.83%
Skin-neck [redact] (1.73.41)	3.694	10.52%	3.744	11.24%
Skin-neck [redact] (1.73.4)	3.694	10.67%	3.744	11.16%
Skin-[redact][redact]	3.656	2.29%	3.708	2.32%
RBM [redact]	2.773	3.55%	3.859	4.74%
Skin-[redact][redact]	3.658	2.27%	3.708	2.23%
Combined POC		40.59%		41.17%

As shown in Table 3-1, SC&A's and NIOSH's dose estimates and resulting POCs are in close agreement. The main difference was in external doses and resulted due to NIOSH applying values all ≥ 1.00 for DCFs, whereas SC&A used the mode values as listed in OCAS-IG-001.

A more detailed discussion of variables that contributed to key differences in dose assignments is presented below.

- Dose Reconstruction Methodology
 - SC&A employed a best-estimate approach to dose reconstruction throughout.
 - NIOSH employed best-estimate and some over-estimate approaches to external doses, and a best-estimate approach to internal dose reconstruction.
- Dose Conversion Factors
 - SC&A applied DCFs as recommended in ORAUT-OTIB-0017 and OCAS-IG-001.
 - NIOSH applied DCFs using ORAUT-OTIB-0017 and OCAS-IG-001 data; however, when any of the DCFs were <1.0 , NIOSH used a DCF of 1.00 as an over-estimating methodology.
 - This difference in methodology resulted in NIOSH assigning larger recorded and missed external doses in some instances.
- Dose Distribution
 - SC&A used the following dose distributions:
 - Recorded photon dose; normal distribution with 30% uncertainty
 - Missed photon dose; lognormal distribution with 1.50 GSD
 - Medical x-ray dose; normal distribution with 30% uncertainty
 - Internal environmental dose; constant with no uncertainty.

Effective Date:	Revision No.	Document No.	Page No.
April 13, 2015	0 (Draft)	SCA-TR-DRC2015-CN [Redact]	17 of 21

- NIOSH used the following dose distributions:
 - Recorded photon skin dose; constant with no uncertainty
 - Recorded prostate and RBM photon doses; constant (with dose multiplied by a 1.3 uncertainty factor) with no uncertainty in the distribution
 - Missed photon dose; lognormal distribution with a 1.50 GSD
 - Medical x-ray dose; normal distribution with a 30% uncertainty
 - Internal environmental dose; constant with no uncertainty.
- The difference in distributions for recorded doses resulted in NIOSH deriving greater recorded doses than SC&A in some instances.
- Assignment of Missed External Dose
 - Both SC&A and NIOSH derived the same number of missed photon and electron doses.
 - SC&A applied the dosimeter LOD value of 0.040 rem for the months of January and February of [redact], and the lower value of 0.030 rem thereafter; as recommended in ORAUT-TKBS-0008-6, Table 6-1, page 19.
 - NIOSH applied the larger dosimeter LOD value of 0.040 rem for the entire year of [redact] to missed skin dose, but the lower LOD value of 0.030 rem to the prostate and RBM for the entire year of [redact].
 - This created some differences in the derived missed photon doses for the year [redact], and the resulting total doses; this varied depending on the organ.
- Assignment of [Redact] Skin Cancer Missed Photon Dose
 - SC&A used 6 zeros for missed photon dose for the [redact], skin cancer.
 - NIOSH used 12 zeros for missed photon dose for the [redact], skin cancer.
 - This difference in methodology resulted in NIOSH assigning a greater missed photon dose for the [redact] skin cancer, as compared to SC&A's dose value.
- Assignment of Onsite Ambient Dose
 - Neither SC&A nor NIOSH assigned onsite external ambient dose because the EE was assigned recorded or missed doses for the entire employment period at NTS.
- Assignment of Occupational Medical X-ray Dose
 - Both SC&A and NIOSH used the number and view of recorded exams in the DOE files for this EE to assign medical x-ray doses.
 - Both SC&A and NIOSH used the dose tables in NTS ORAUT-TKBS-0008-3 to assign doses.
 - Medical dose assigned by SC&A and NIOSH for the various cancers closely matched.

--	----------------------------------	--	-----------------------------

- Assignment of Internal Dose

- Both SC&A and NIOSH used the best-estimate approach to assign environmental intakes/doses.
- Both SC&A and NIOSH used the NTS environmental default intakes to assign environmental intakes/doses.
- Internal doses assigned by SC&A and NIOSH for the various cancers were identical.

1.0 SUMMARY BACKGROUND INFORMATION

This report presents the results of an independent blind dose reconstruction (DR) performed by SC&A for an energy employee (EE) who worked as a [redact] at the Nevada Test Site (NTS) during the following periods:

- [redact]–[redact]
- [redact]–[redact]
- [redact]–[redact]
- [redact]–[redact]

The EE was diagnosed with eight cancers during the period [redact]–[redact], summarized in Table 1:

Table 1. Summary of Cancers

Cancer	Cancer Site	ICD-9 Code	Year
#1	Malignant melanoma [redact]	172.5	[redact]
#2	BCC [redact] scalp	173.41	[redact]
#3	Prostate	185	[redact]
#4	BCC [redact] neck	173.41	[redact]
#5	Melanoma [redact] neck	172.4	[redact]
#6	SCC in-situ [redact]	232.32	[redact]
#7	Essential thrombocythosis	238.71	[redact]
#8	SCC in-situ [redact]	232.3	[redact]

BCC = Basil cell carcinoma, SCC = Squamous cell carcinoma

This was a partial DR, because not all internal doses could be assigned prior to 1993, as per the NTS Special Exposure Cohort (SEC), which is discussed in ORAUT-TKBS-0008-5, page 13. The EE was employed at NTS during the SEC period; however, since at least one of the cancers was a non-presumptive cancer, a DR was required.

According to Department of Labor (DOL) files and the Computer-Assisted Telephone Interview (CATI) report, the EE was a [redact] at NTS. The EE worked in the [redact] as needed. The EE was monitored for external photon exposure during most of the employment periods at NTS, but was not bioassayed.

1.1 SC&A'S BLIND DR APPROACH

SC&A reviewed all of the DOE records provided on behalf of this employee and the NIOSH procedures relevant to this case, which included the Technical Basis Document (TBD) for the NTS (issued as six separate documents numbered ORAUT-TKBS-0008-1 through ORAUT-TKBS-0008-6), ORAUT-OTIB-0005 for surrogate organs, OCAS-IG-001 for dose conversion factors (DCFs), and ORAUT-OTIB-0017 for skin doses. Using the guidance provided in these documents, along with the EE's dosimetry records, SC&A calculated reasonable, claimant-favorable annual organ doses for each of the eight cancer sites. Table 2 provides a summary of the total doses assigned to each cancer site. Appendices A-1 through A-8 provide a list of SC&A's assigned annual organ dose, and also includes the Interactive RadioEpidemiological

Internal Dose, Environmental:						
Alpha	29–71	0.007	48–96	0.208	29–71	0.007
>250 keV Photons	72–114	0.001	97–145	0.003	72–114	0.001
>15 keV Electrons	115–157	0.002	146–194	0.023	115–157	0.002
Total		3.656		2.773		3.658
Cancer POC		2.29%		3.55%		2.27%

SC&A determined the probability of causation (POC) for this case using the annual doses as input into the NIOSH POC program. The doses shown in Table 2 produced a total POC of **40.59%**.

2.0 EXTERNAL DOSES

To perform this DR, SC&A analyzed the Department of Energy DOE files containing the monthly badge readings. Most of the recorded readings were zero, with only one positive reading recorded in [redact].

SC&A used the DR parameters as recommended in ORAUT-TKBS-0008-6, which consisted of an energy range of 22% 30–250 keV photons, 78% >250 keV photons (Table 6-13, page 50) associated with routine [redact] operations, and a limit of detection (LOD) value of 0.040 rem for [redact] through [redact] and 0.030 rem for [redact] through [redact] (Table 6-1, page 17). Exposure (as opposed to deep) DCFs were used, as per ORAUT-TKBS-0008-6, pages 19–20. The urinary bladder was used as the surrogate organ for the prostate (ORAUT-OTIB-0005, page 20), and the red bone marrow (RBM) was used as the surrogate organ for the thrombocytosis (ORAUT-OTIB-0005, page 38). SC&A used DCFs as recommended in OCAS-IG-001 [for anterior-posterior (AP) geometry], which consisted of a prostate 30–250 keV photon DCF of 1.244, a >250 keV photon DCF of 0.883 (page 46), an RBM 30–250 keV photon DCF of 0.626, and a >250 keV photon DCF of 0.720 (page 47). A skin DCF of 1.00 was used, as per ORAUT-OTIB-0017, page 6.

2.1 RECORDED PHOTON DOSES

SC&A used the [redact] recorded photon dose value of 0.050 rem to assign measured photon doses using the parameters previously described. There were no electron doses recorded \geq LOD/2.

Example of [redact] recorded photon dose calculations – SC&A calculated the [redact] photon dose to the prostate as follows:

Records show that for the month of [redact], the EE received a deep dose of 0.050 rem. The photon dose was assumed to be 22% 30–250 keV and 78% >250 keV. Prostate DCFs of 1.244 for 30–250 keV photons and 0.883 for >250 keV photons were applied.

$$\begin{aligned} \text{30–250 keV photon dose} &= \text{D.D.} \times \text{DCF} \times \text{Energy f.} \\ &= 0.050 \times 1.244 \times 0.22 \\ &= 0.014 \text{ rem} \end{aligned}$$

$$\begin{aligned} \text{>250 keV photon dose} &= \text{D.D.} \times \text{DCF} \times \text{Energy f.} \\ &= 0.050 \times 0.883 \times 0.78 \\ &= 0.034 \text{ rem} \end{aligned}$$

SC&A's calculated [redact] 30–250 keV and >250 keV doses are shown in entries #1 and #2, respectively, of Appendix A-3 for the prostate.

The recorded photon doses were entered into the IREP as a normal distribution with a 30% uncertainty (ORAUT-TKBS-0008-6, page 91, was the best guidance available). SC&A assigned

Effective Date: February 12, 2015	Revision No. 0 (Draft)	Document No. SCA-TR-BDR2015-CN [Redact]	Page No. 8 of 43
---	----------------------------------	---	----------------------------

recorded doses to the eight cancer sites in entries #1–#2 of the IREP Input tables; as summarized in Table 2 above, and detailed in Appendices A-2 through A-8.

2.2 MISSED PHOTON/ELECTRON DOSES

SC&A analyzed the number of physical zeros based on a monthly badge exchange cycle and arrived at a total of 207 zeros, or <LOD/2 values, for photons. SC&A used the annual number of zeros, the LOD/2 value, the DR parameters as listed above, and the applicable DCFs to determine the annual missed photon and electron doses. SC&A noted that during the year [redact], the LOD value changed from 0.040 rem during January and February to 0.030 rem for March through December. SC&A used the appropriate LOD values for each time period in assigning dose in the IREP tables.

Example of [redact] missed photon dose calculations – SC&A calculated the missed [redact] photon dose to the prostate as follows:

Records show that for the 12 months of [redact], the EE had received a deep dose of 0.050 rem; plus, 11 zeros were recorded. The photon dose was assumed to be 22% 30–250 keV and 78% >250 keV. Prostate DCFs of 1.244 for 30–250 keV photons and 0.883 for >250 keV photons were applied. The LOD for [redact] was 0.030 rem.

$$\begin{aligned}\text{Missed Photon Dose (30–250 keV)} &= (\# \text{ zeros} \times \text{LOD}/2) \times \text{DCF} \times \text{Energy f.} \\ &= (11 \times 0.015 \text{ rem}) \times 1.244 \times 0.22 \\ &= 0.045 \text{ rem}\end{aligned}$$

$$\begin{aligned}\text{Missed Photon Dose (>250 keV)} &= (\# \text{ zeros} \times \text{LOD}/2) \times \text{DCF} \times \text{Energy f.} \\ &= (11 \times 0.015 \text{ rem}) \times 0.883 \times 0.78 \\ &= 0.114 \text{ rem}\end{aligned}$$

The photon missed doses were entered into IREP as a lognormal distribution with an uncertainty of 1.520. The missed photon doses were assigned in the IREP Input tables, as summarized in Table 2 above, and detailed in Appendices A-1 through A-8. Missed photon dose to the skin cancer sites were assigned as 100% 30–250 keV photons, as recommended in ORAUT-OTIB-0017, page 18.

2.3 NEUTRON DOSE

SC&A found that, as a [redact], the EE most likely would not have been exposed to significant neutron doses; therefore, as per ORAUT-TKBS-0008-6, page 43, no neutron dose was assigned in this case.

2.4 OCCUPATIONAL MEDICAL DOSE

Records

The DOE records show that the EE received a routine x-ray exam in [redact], [redact], and [redact] (a [redact] exam was performed in [redact], but was labeled as non-occupational, and

Effective Date:	Revision No.	Document No.	Page No.
February 12, 2015	0 (Draft)	SCA-TR-BDR2015-CN[Redact]	9 of 43

not included as per recommendations in ORAUT-TKBS-0008-3, page 10). Posterior-anterior (PA) views were assumed for all exams, plus lateral (LAT) views for those taken after [redact], as per ORAUT-TKBS-0008-3, Table 3-1, page 7.

SC&A used the appropriate prostate and RBM dose values recommended in Table 3-3, page 11, of ORAUT-TKBS-0008-3 as a function of the year the exam was performed, and the appropriate skin doses from Table 3-5, page 13, for five of the six skin cancer sites. The eye/brain dose was used as a surrogate for the skin of the forehead, because of its physical location, to assign occupational medical x-ray doses in the IREP Input tables. A summary of the locations used for the cancer sites is listed below:

- #1 [redact] – [redact]
- #2 scalp – Right side of head
- #3 prostate – Urinary bladder/prostate
- #4 [redact] neck – Back of neck
- #5 [redact] neck – Back of neck
- #6 [redact] – Eye/brain
- #7 thrombocytosis – Bone marrow (male)
- #8 [redact] – Left side of face

The doses assigned are summarized in Table 2 above, and detailed in Appendices A-1 through A-8. The annual occupational medical dose values were entered into the IREP as a normal distribution with 30% uncertainty and a photon energy range of 30–250 keV.

2.5 ONSITE AMBIENT DOSE

As per ORAUT-PROC-0060, Attachment A, page 14, external ambient dose should not be applied when the EE is assigned recorded (and/or missed) dose. Therefore, no external ambient dose was assigned in this case since the EE was assigned recorded and/or missed doses for all years of employment.

Effective Date:	Revision No.	Document No.	Page No.
February 12, 2015	0 (Draft)	SCA-TR-BDR2015-CN [Redact]	10 of 43

3.0 INTERNAL DOSES

There were no bioassay records in the EE's DOE files. Therefore, according to the NTS SEC, internal dose could not be reconstructed, except for environmental.

3.1 INTERNAL ENVIRONMENTAL INTAKES/DOSES

Intake and Doses

SC&A used the NTS default environmental intakes in the chronic annual dose workbook (CADW), located in the DR Tools folder, to derive the intakes and corresponding annual doses for each of the eight cancers. As per ORAUT-OTIB-0005 guidelines, SC&A used *all male genitalia* as the surrogate organ for the prostate (page 20); the *bone* and also *lymphoma & multiple myeloma* for the thrombocytosis (page 38); and the corresponding type of skin cancer (i.e., malignant melanoma, BCC, or SCC) for each skin cancer site in the CADW. The doses consisted of contributions from alphas, >250 keV photons, and >15 keV electron emitters.

IREP Tables

The annual doses from the CADWs were entered into the IREP Input tables (one IREP table for each cancer, for a total of eight IREP tables) up through the date of diagnosis for each of the cancer sites. The annual dose values were entered into the IREP tables with a constant distribution and an uncertainty value of 0.000.

For the thrombocytosis cancer, two IREP input tables were created, one using the *bone* and the other using *lymphoma & multiple myeloma* as the IREP model, as recommended in ORAUT-OTIB-0005, page 38. Both of these IREP tables were analyzed using the POC program and found to produce the same POC in this case.

4.0 CATI REPORT AND RADIOLOGICAL INCIDENTS

SC&A reviewed the DOE records in behalf of Case # [redact] and the CATI report (which was provided by the EE) to determine if the EE was involved in any radiological incidents. The CATI did not indicate any known radiological accidents or incidents. The EE did have concerns that the drinking water in Area 3 may have been contaminated; however, as outlined in the NTS SEC, no further internal dose assignments can be made. Additionally, the EE indicated that in the late [redact]s or early [redact]s, the EE was involved in work that required that the workers spend only a short time in an area because of heavily-radiated material. It is not known if this was because of internal or external radiation exposure potential; however, further internal doses cannot be reconstructed, and the EE was monitored for external exposures during this time and those data were used in the external dose section of this DR.

SC&A did not find any further documentation of radiological incidents that would impact the radiation doses assigned in this case.

5.0 SUMMARY CONCLUSIONS

This partial DR used best-estimate methods to obtain reasonable external and internal dose assignments.

The total POC for the eight cancers was calculated using the NIOSH-Interactive Radio-Epidemiological Program (v.5.7.1) and was determined to be 40.59%.
