

Pandemic Vaccine Program Distribution, Tracking, and Monitoring

During a pandemic, CDC will scale up existing vaccine distribution, tracking, and monitoring systems to support the response.

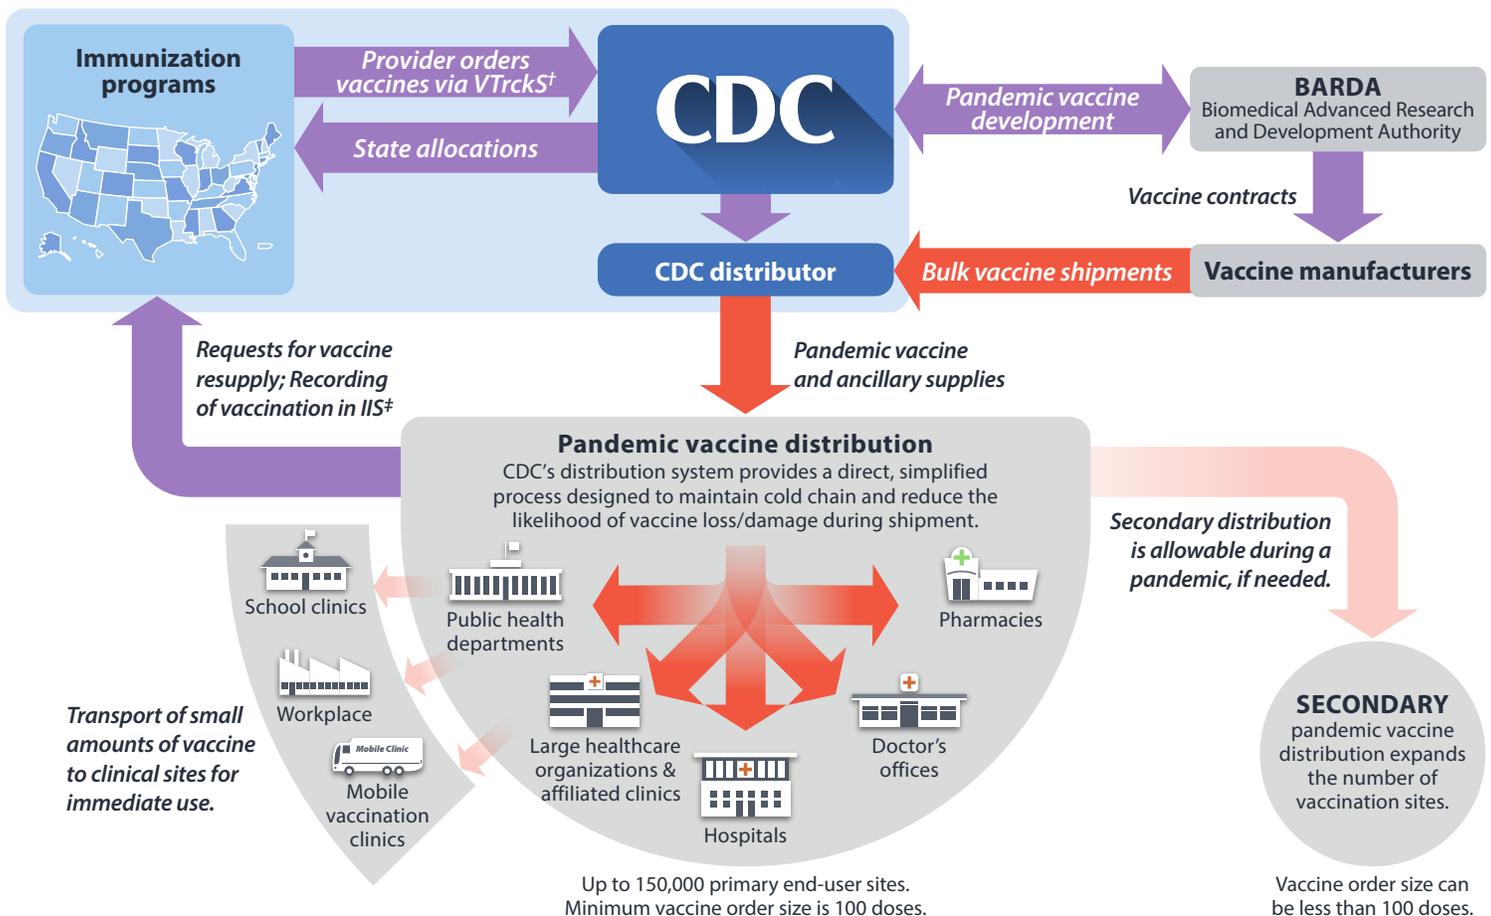

Vaccine handling, distribution, and tracking

Secure storage and safe and efficient distribution of vaccine are the cornerstones of a successful vaccination program. CDC's vaccine distribution system, which transfers products to sites where they will be securely stored for later use, is flexible, scalable, and tested. This system ensures maintenance of cold chain*, which is essential to vaccine effectiveness. Each year, CDC distributes over 75 million doses of vaccines from every vaccine manufacturer to health departments and

private health providers across the country. From these sites, vaccine may be transported in small quantities to clinical sites for immediate use, while maintaining cold chain. During an emergency, this proven system can be scaled up and expedited to manage and distribute almost 900 million doses of vaccine. It is the only existing vaccine distribution system with the capacity and flexibility to reach the entire nation to support the needs of a pandemic.

Distribution of pandemic vaccine and supplies
